

Built Environment and Active Living: People with High Health Risk and Low Income

Active Living Research
Annual Conference

San Diego, CA

February 18, 2006

Chanam Lee, Ph.D.

Department of Landscape Architecture
and Urban Planning
College of Architecture
Texas A&M University

Background

- Disparities in physical activity and health
- Disparities in the environmental supports for active living
- Social and physical environment in the neighborhood
- Physical activity for transportation and recreation purposes

Objectives

- To examine the associations that the built and social environments of the neighborhood have with physical activity for two sub-populations:
 - People with high health risk
 - People with low income

considering, physical activity for recreation purposes and transportation purposes

Methods

■ Sample Frame/Study Area and Regional Context

- medium to high residential densities
- some retail-commercial activities

■ Study Population and Sampling

- English-speaking, able-bodied adults living in households with telephone
- Spatial Sampling and simple random sampling (*Lee, et al. 2005*)

2

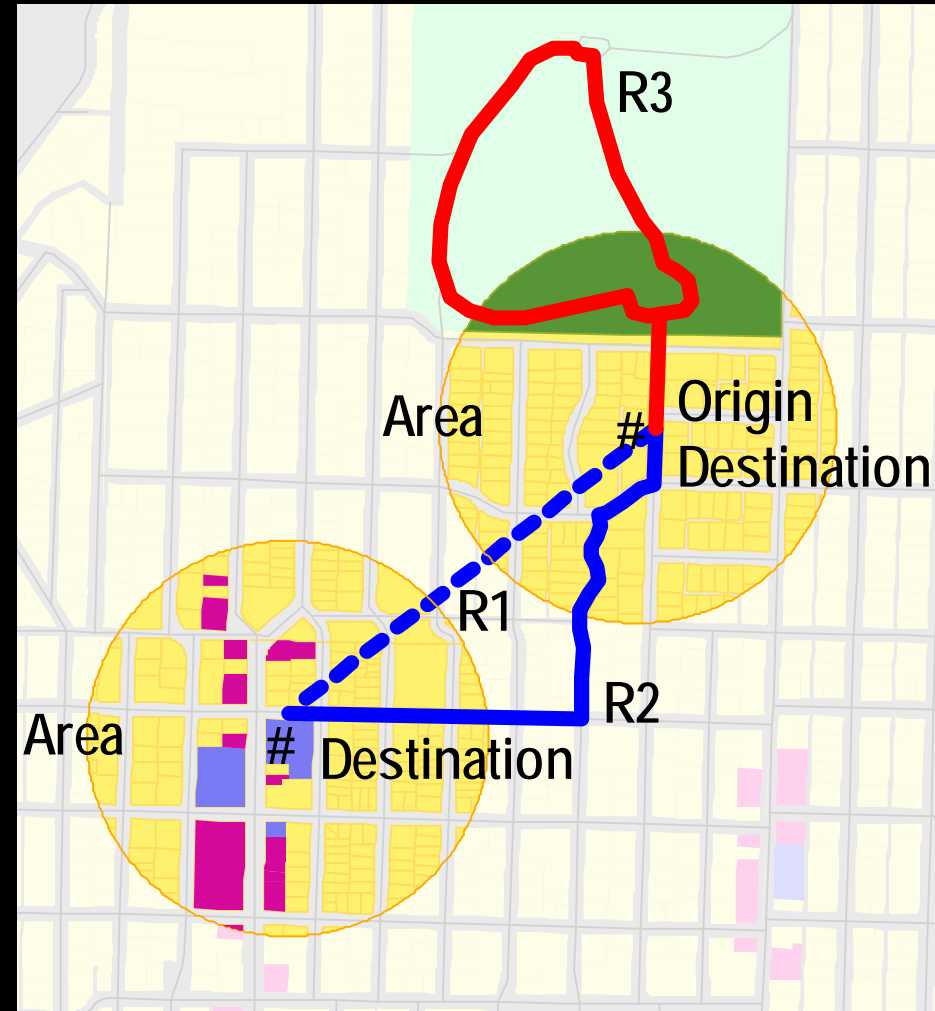

Conceptual Frameworks

Social Ecological Framework

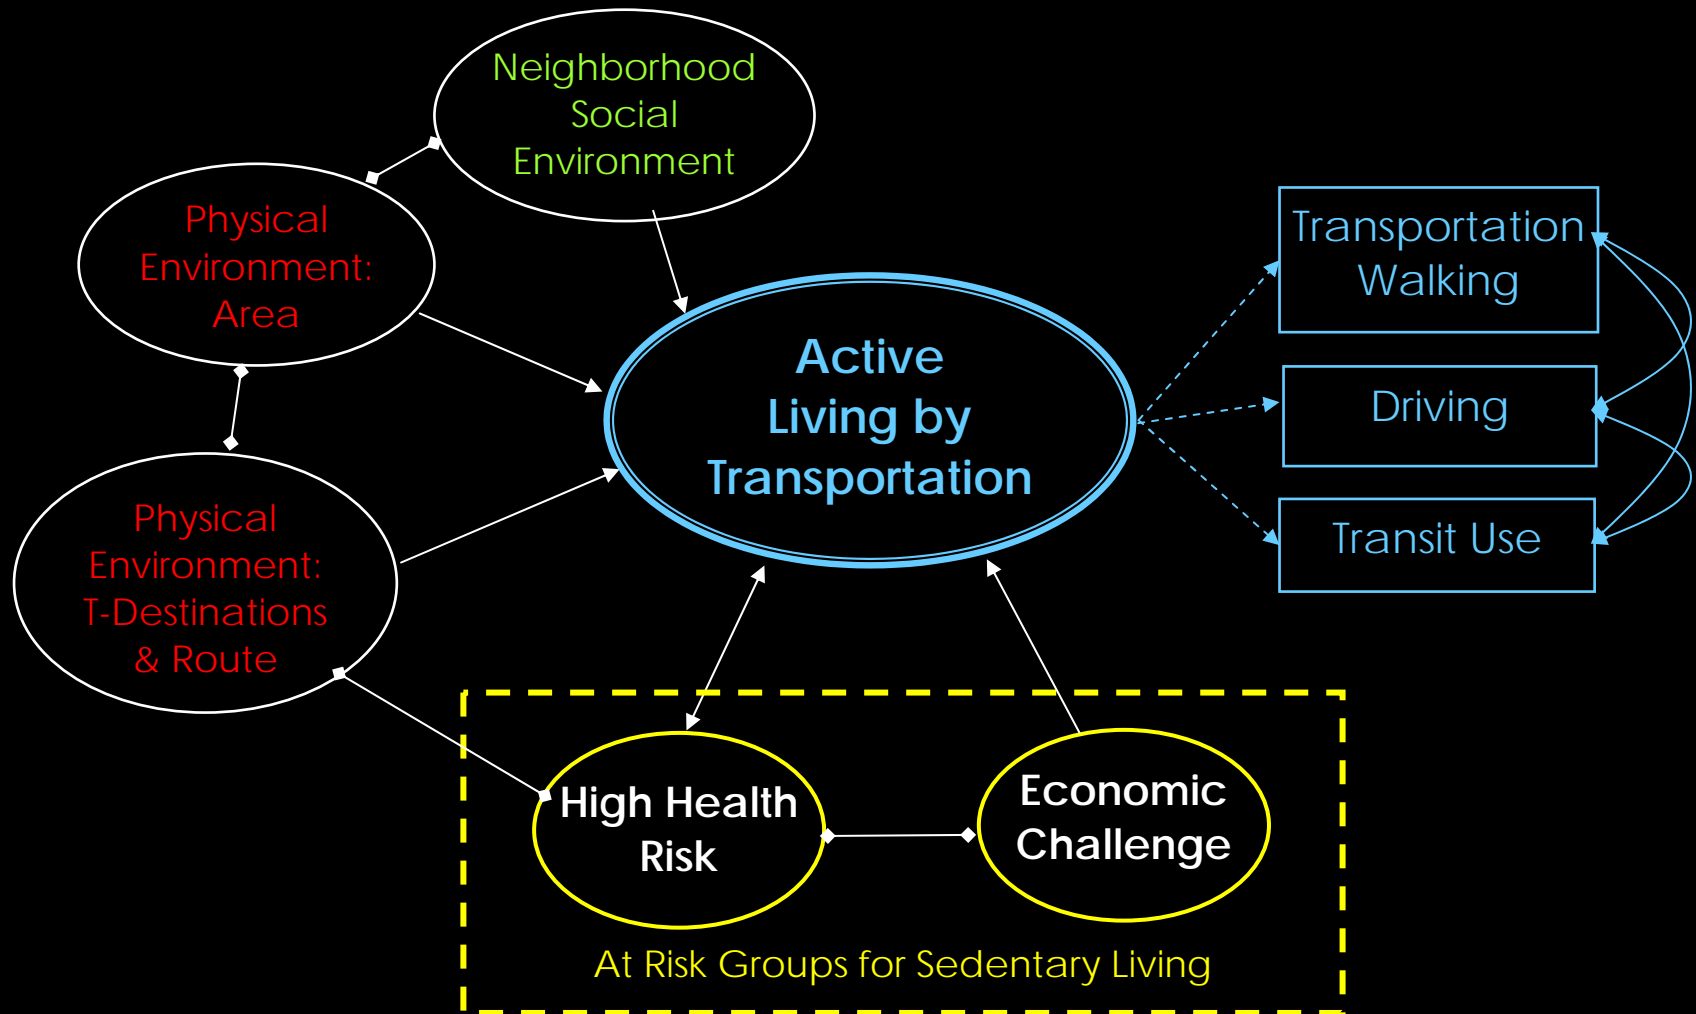

- Personal
- Social
- Physical Environmental
 - Subjective (Perceived)
 - Objective (Actual)

Behavioral Model of Environment

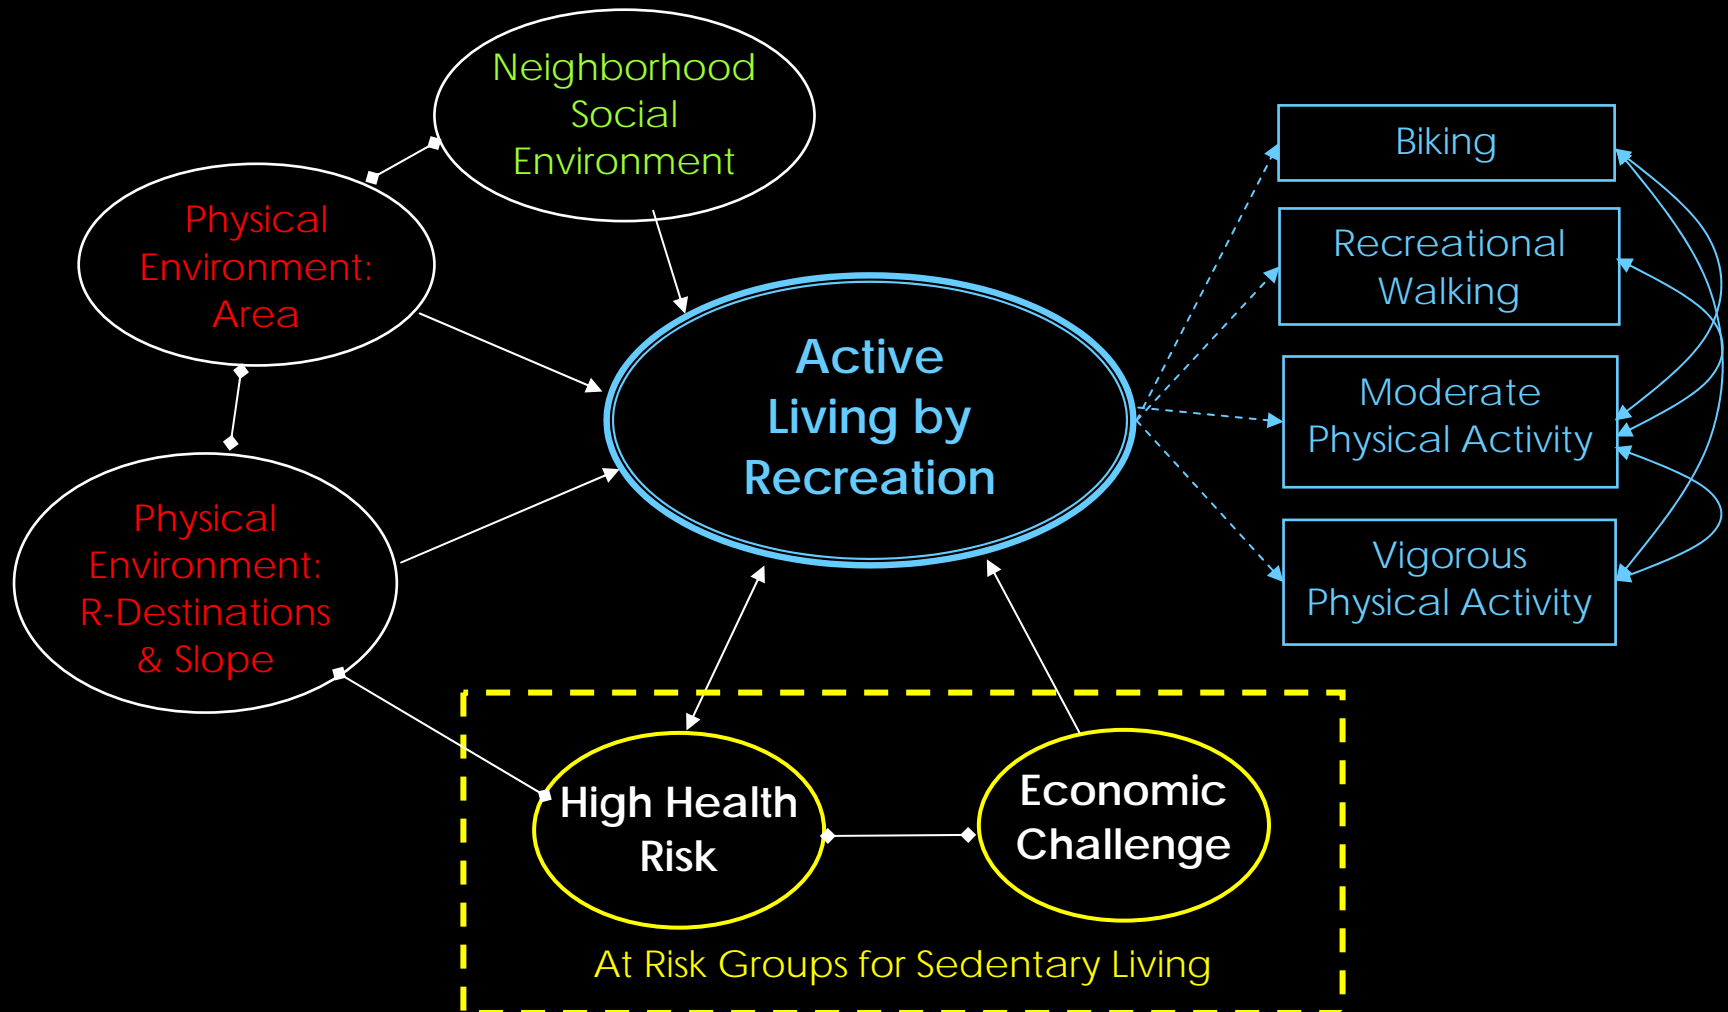

- Origin-Destination
 - Recreational Destination
 - Transportation Destination
- Route
- Area

Conceptual Framework: Active Living by Transportation

Conceptual Framework: Active Living by Transportation

Socio-demographic Variables

WBC Survey (Telephone Interview)

- Walking
- Biking
- Transit Use
- Neighborhood Perception
- Attitude
- Physical Activity
- Household Characteristics
- Demographic Characteristics
- Short Section for the Initially Refusing Respondents

Environmental Variables:

Custom-made ArcView Extension - WBC Analyst

Home-based Proximity Measures

e.g. Distance to 31 individual and 11 agglomerations of destinations (Neighborhood Centers or NCs)

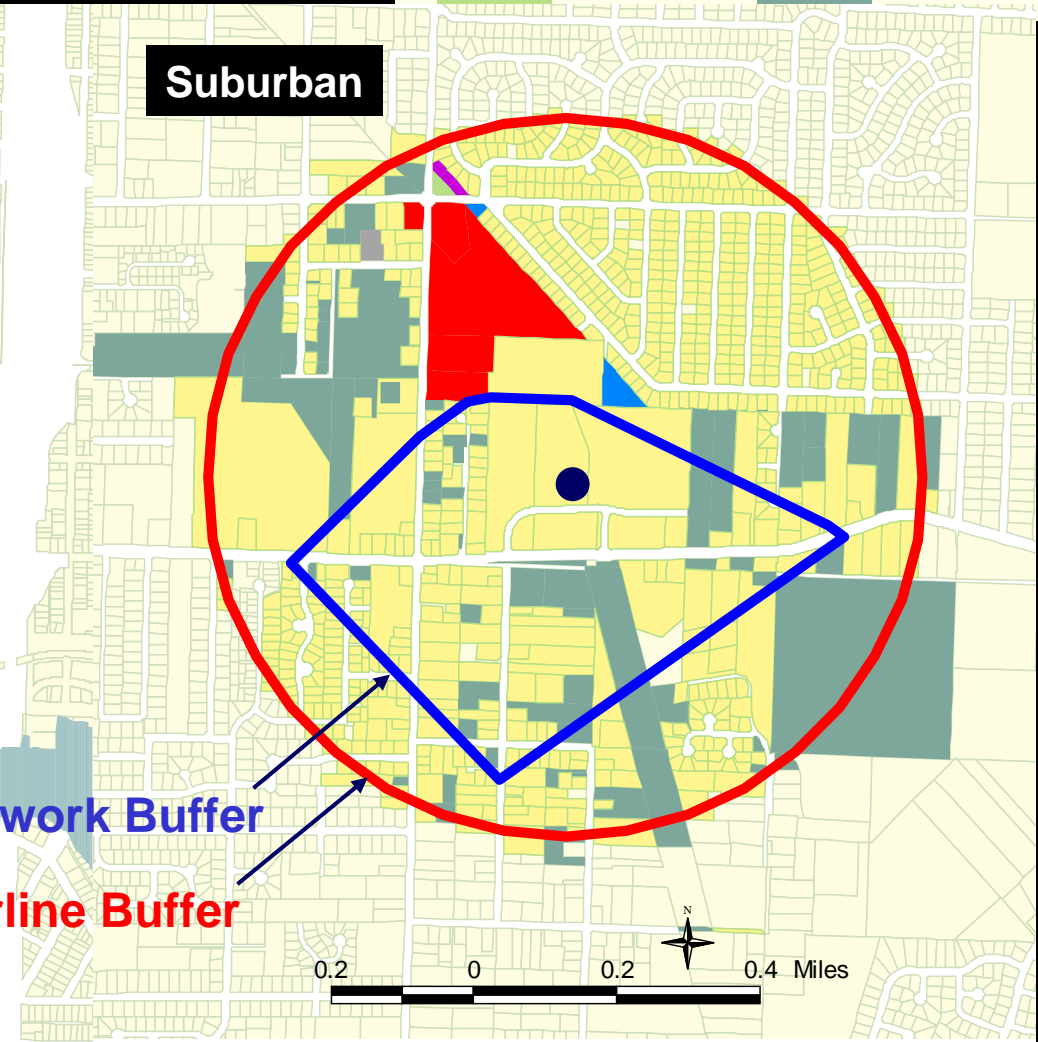

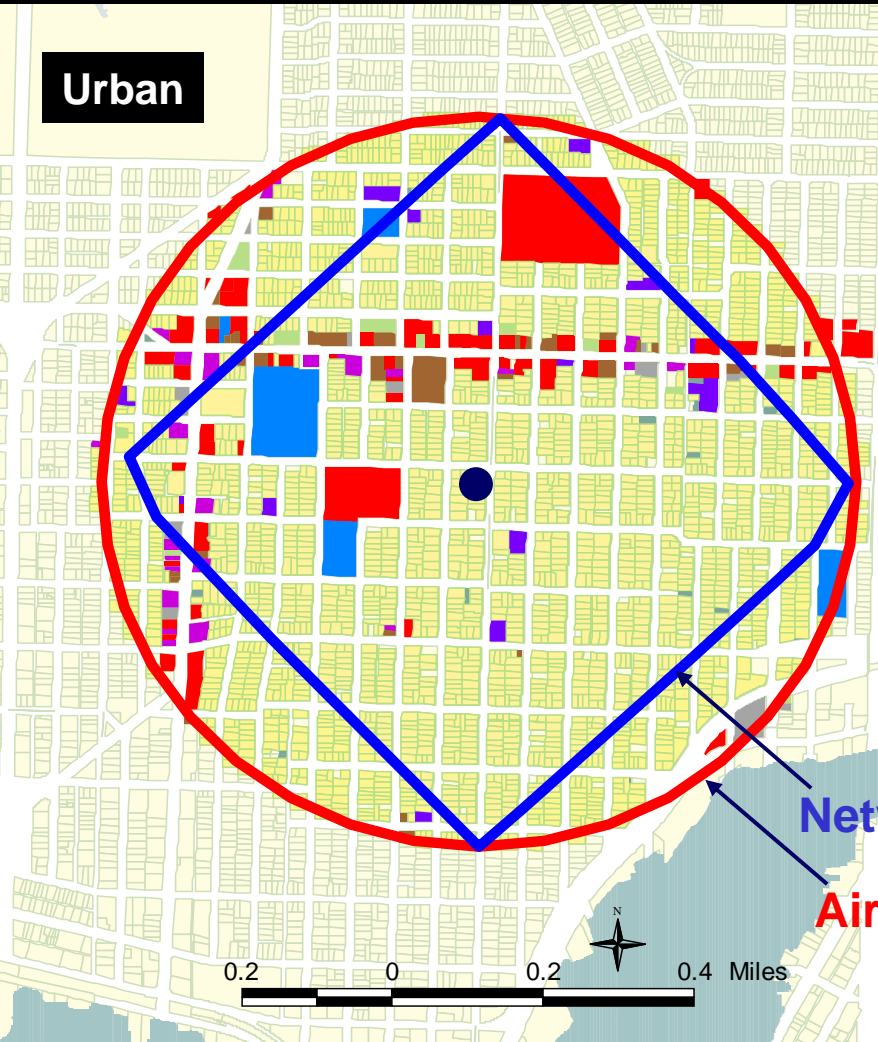

Home-based Buffer Measures

e.g. Density, land use mix, extent and completeness of sidewalks, bike lanes, and trails, traffic conditions, block size, bus stops and riderships, and slope

Neighborhood Center-based Measures

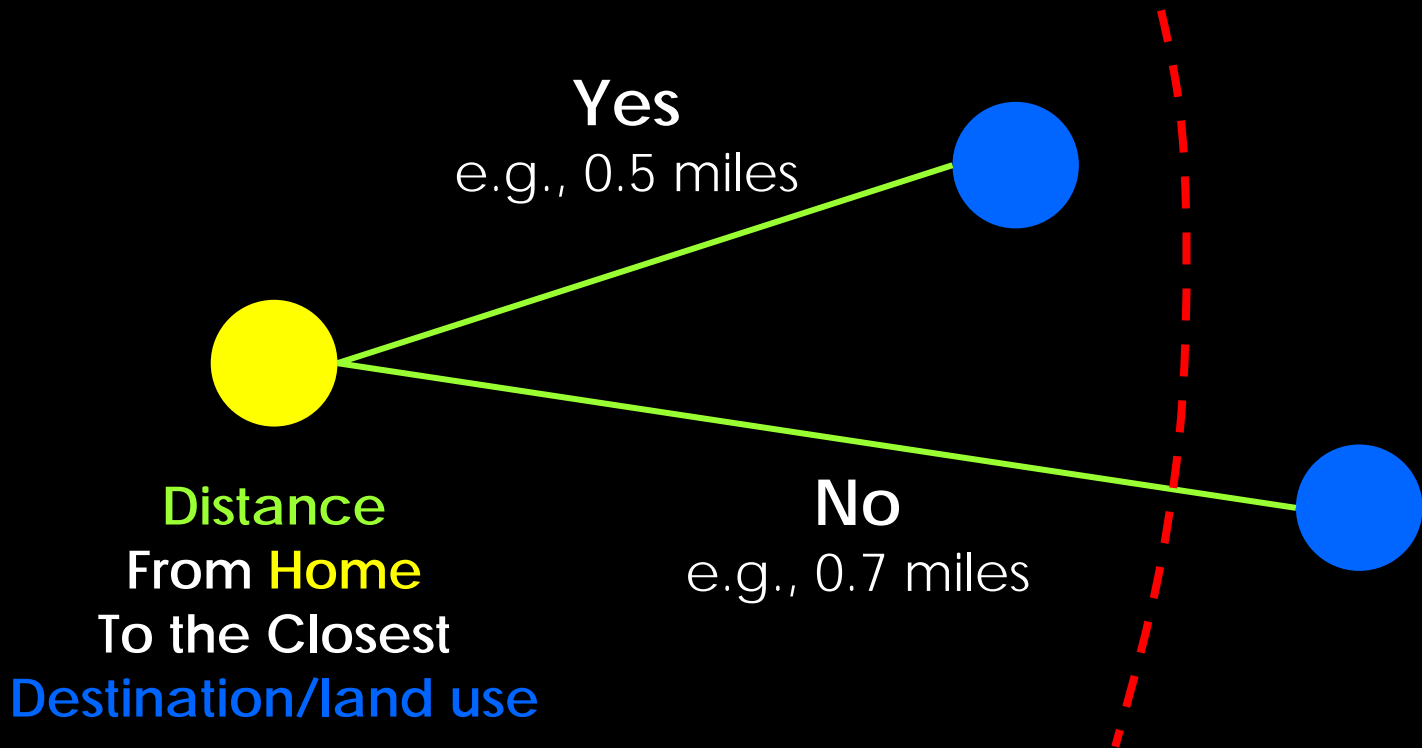

e.g. compactness, diversity, and size of NCs

Home-based Buffer Measures – buffer type Airline and Network Buffers

Home-based Buffer Measures – buffer size Neighborhood Boundary: Perception vs. Reality

Do you have [Destination/land use] in your neighborhood?

Home-based Buffer Measures – buffer size

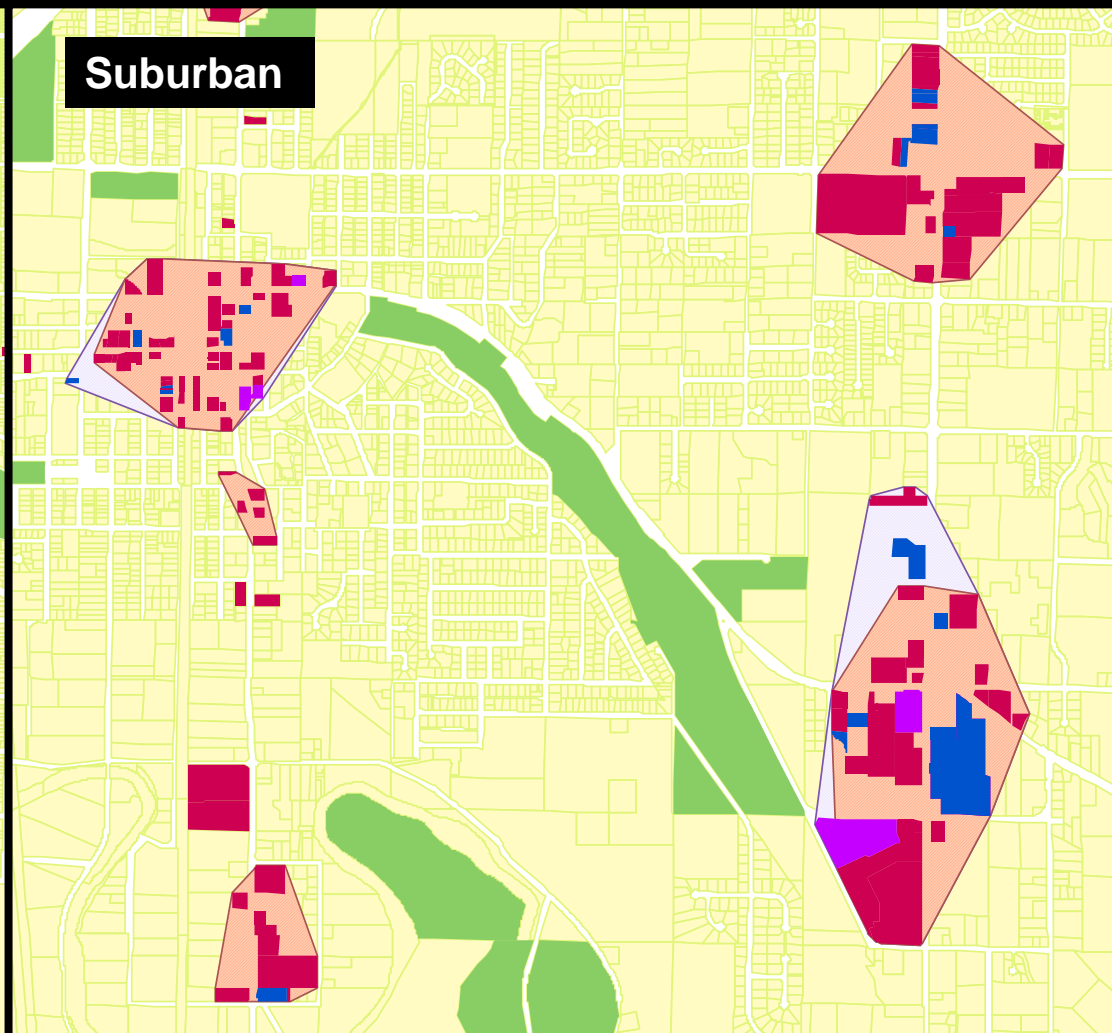

Neighborhood Delineation

	Airline Distance		Network Distance	
	Yes	No	Yes	No
Do you have [Destination] in your neighborhood? (mile)				
• Retail-service facilities	0.11	0.15	0.20	0.24
• Schools	0.23	0.35	0.36	0.53
• Grocery stores	0.24	0.32	0.41	0.59
• Parks	0.34	0.43	0.43	0.53
• Sports facilities	0.64	0.71	0.87	0.94
• Trails	0.75	0.93	0.92	1.13
• Community/neigh shopping centers	0.83	1.23	1.04	1.42
• Fitness centers/gyms	0.99	1.20	1.26	1.48
MEAN	0.52	0.66	0.69	0.86

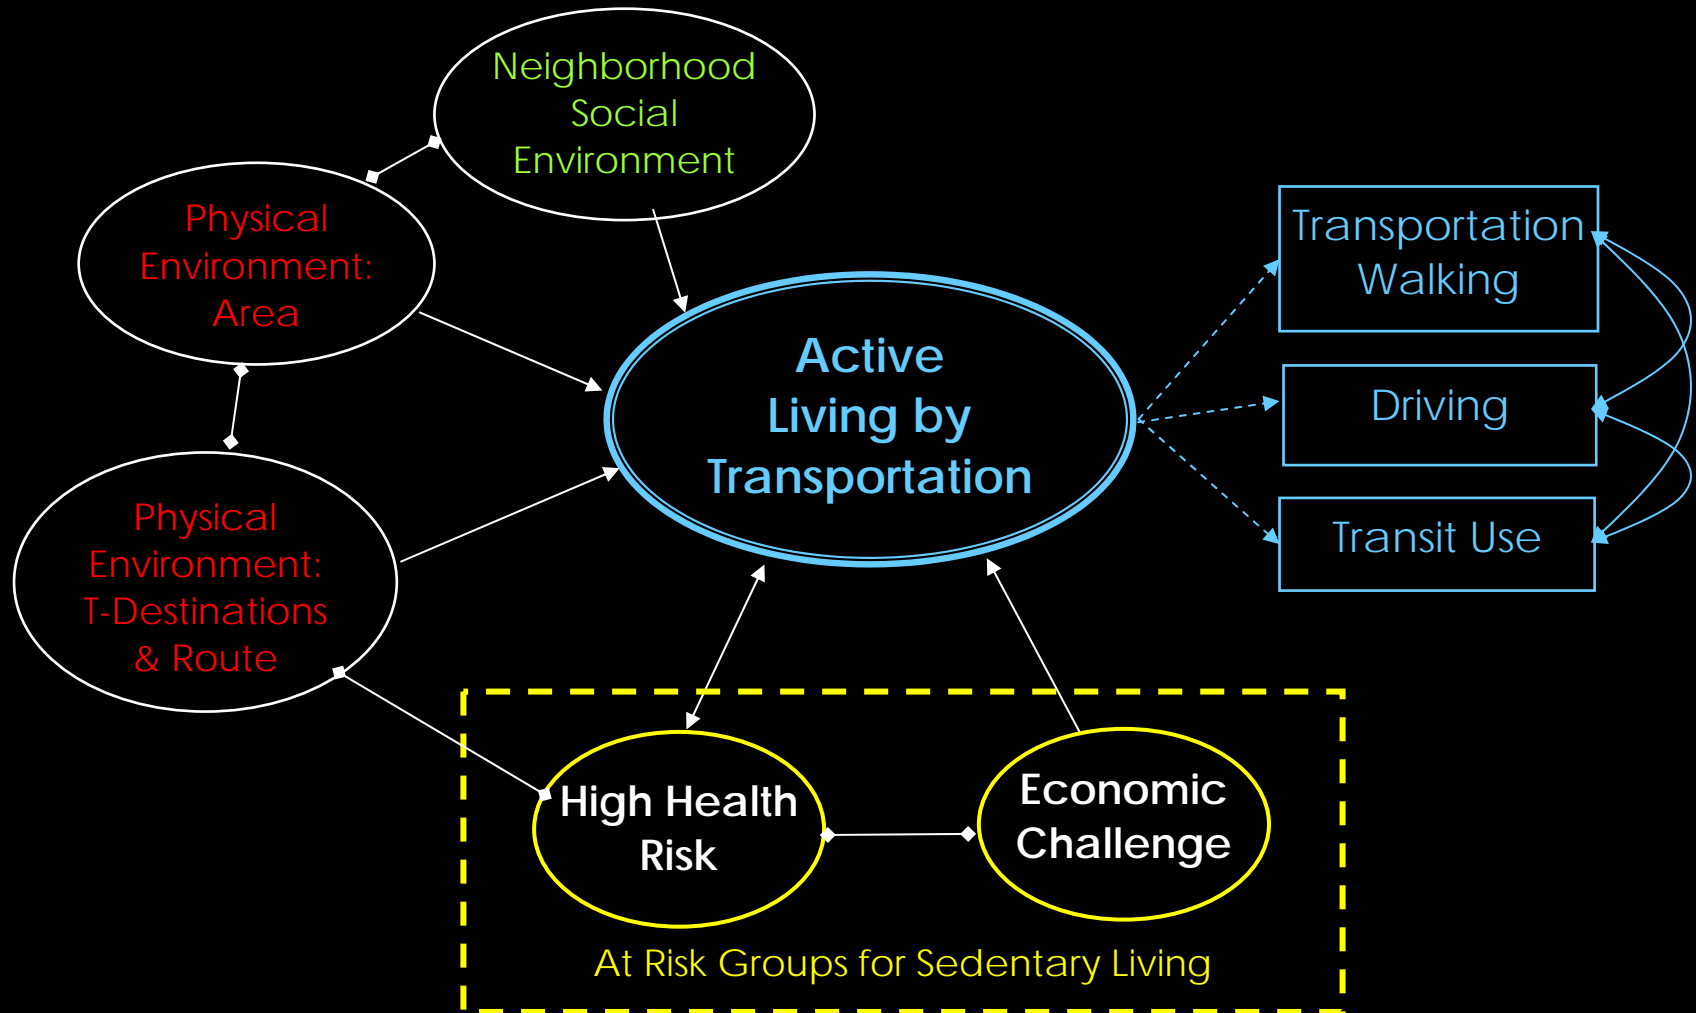

Neighborhood Center-based Measures

- Retail only (3 minimum)
- Retail, Grocery, and Restaurant (1 of each, 3 minimum)

Conceptual Framework: Active Living by Transportation

Active Living Variables

Dependent Variables

Latent Variables

Observed Variables

Active Living
by Transportation

Frequency of walking for transportation (trips/wk)
Transit use (1+/wk vs. no use)
Vehicle miles traveled (monthly VMT)

Active Living
by Recreation

Amount of walking for recreation (min/wk)
Amount of moderate physical activity (min/wk)
Amount of vigorous physical activity (min/wk)
Biking (1+/wk vs. no biking)

Sub-group Variables

Independent Variables

Latent Variables	Observed Variables
Health Risk	Body Mass Index Perceived health status Activity limitation Age Yearly household income
Economic Challenge	Cars in the household Own or rent home Gender Age Yearly household income Parcel-level residential density

Environment Variables

Independent Variables

Latent Variables

Neighborhood

Social Environment

Physical Environment:
Area Characteristics

Physical Environment:
Transportation

Physical Environment:
Recreation

Observed Variables

People biking in the neighborhood

People walking in the neighborhood

Perceived neighborhood type

Area-level mean net residential density

Parcel-level net residential density

Total traffic volume

Total length of sidewalks

Total number of street trees

Distance to the closest grocery store

restaurant

bank

Mean slope

Distance to the closest park

trail

Analytical Methods and Process

Cluster and Factor Analyses

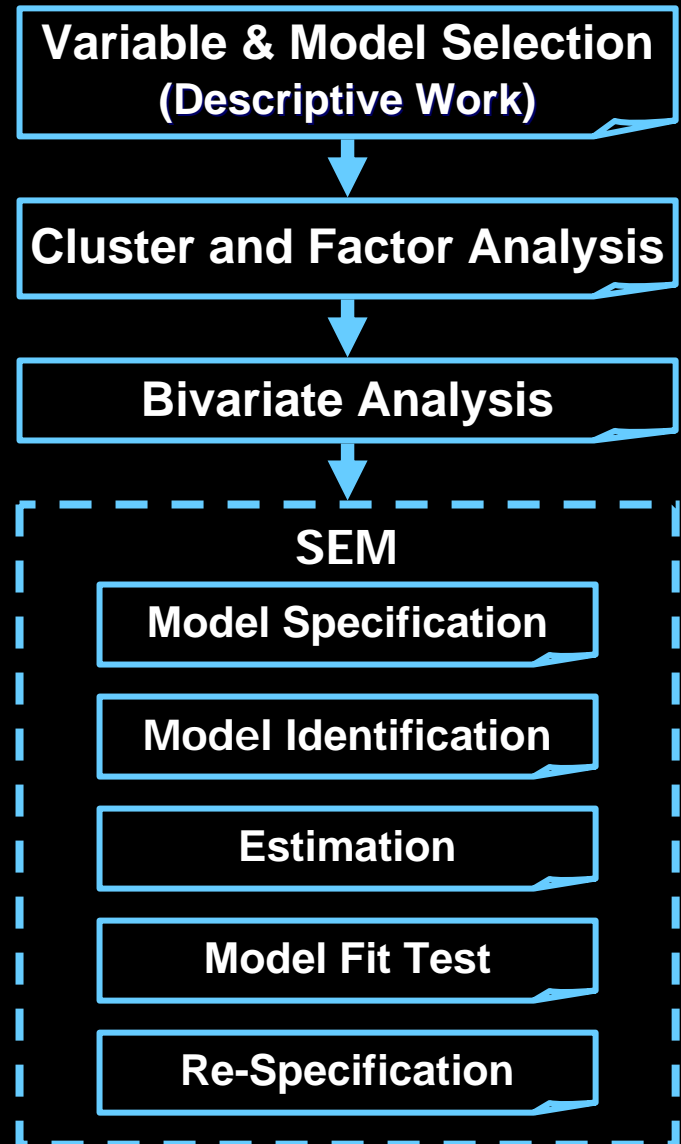

Selection of observed variables to adequately capture the latent variables

Bivariate Analyses

Association between observed variables

Structural Equation Modeling (SEM)

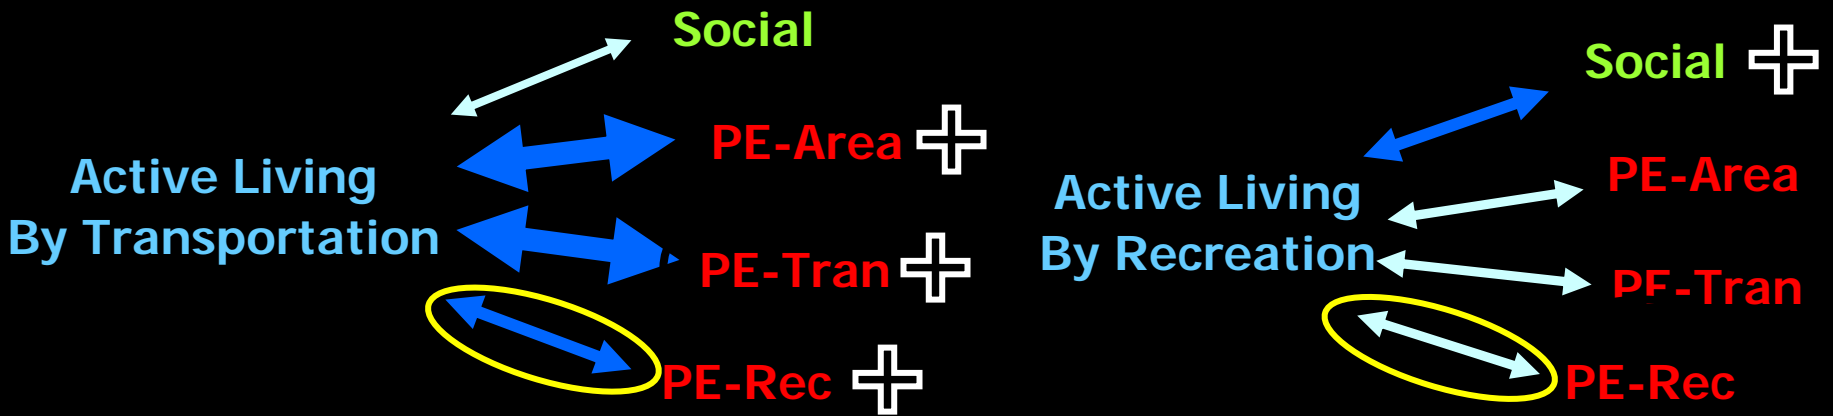

Examination of overall conceptual frameworks by testing a series of hypothesized associations among observed and latent variables

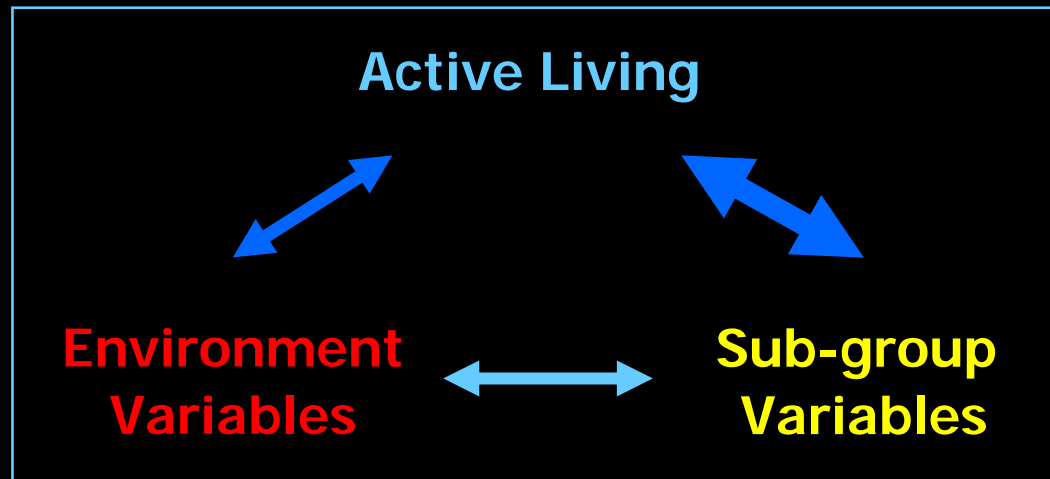

Findings: Bivariate Analyses

		Physical Environment - Area				Physical Environment - Transportation					Physical Environment - Recreation		
		p_ne ityp	den_ area	den_ prcl	trfv1 000	swlk mi	tree1 000	pcnr es_l	pcn ban mi	pcn gro mi	slp_m ean	pcnp akmi	pcntrl_ c

Active Living
By Recreation

Health
Risk

Active Living
By Transportation

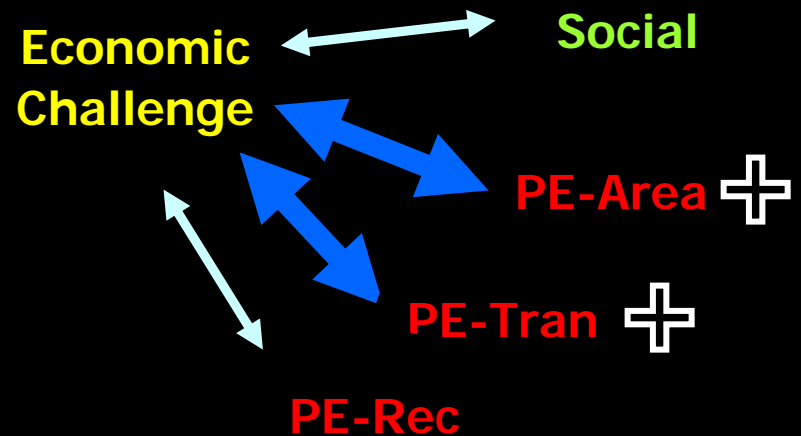

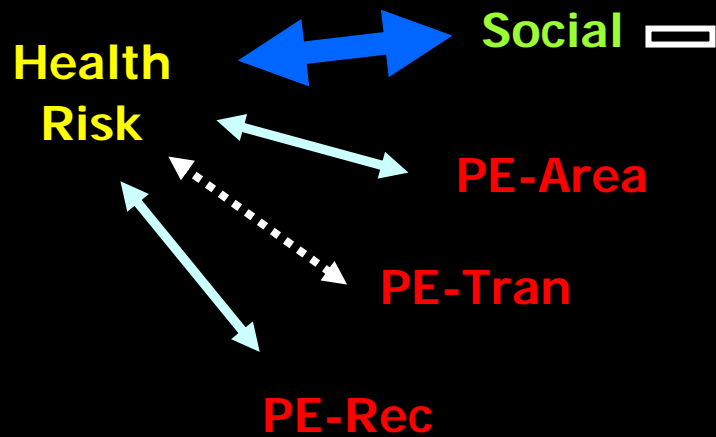

Economic
Challenge

Active Living
By Recreation

Economic
Challenge

Findings: Bivariate Analyses

Bivariate Analysis Findings

- The physical environment had a strong association with transportation physical activity.
- Moderate and vigorous physical activity was associated with reduced health risks.
- Engaging in moderate physical activity was strongly related to a higher health status and a lower BMI.
- Moderate physical activity was associated positively with both social environmental variables.
- Vigorous physical activity showed no significant association with social environmental variables.

Bivariate Analysis Findings

- Higher health risk was associated with less recreational activity, and less supportive social environment.
- Proximity to trails was associated with lower BMI.
- Hilly areas had a positive association with high economic status.
- Lower income populations lived in areas with more routine destinations such as restaurants and grocery stores, and higher densities.

Findings:

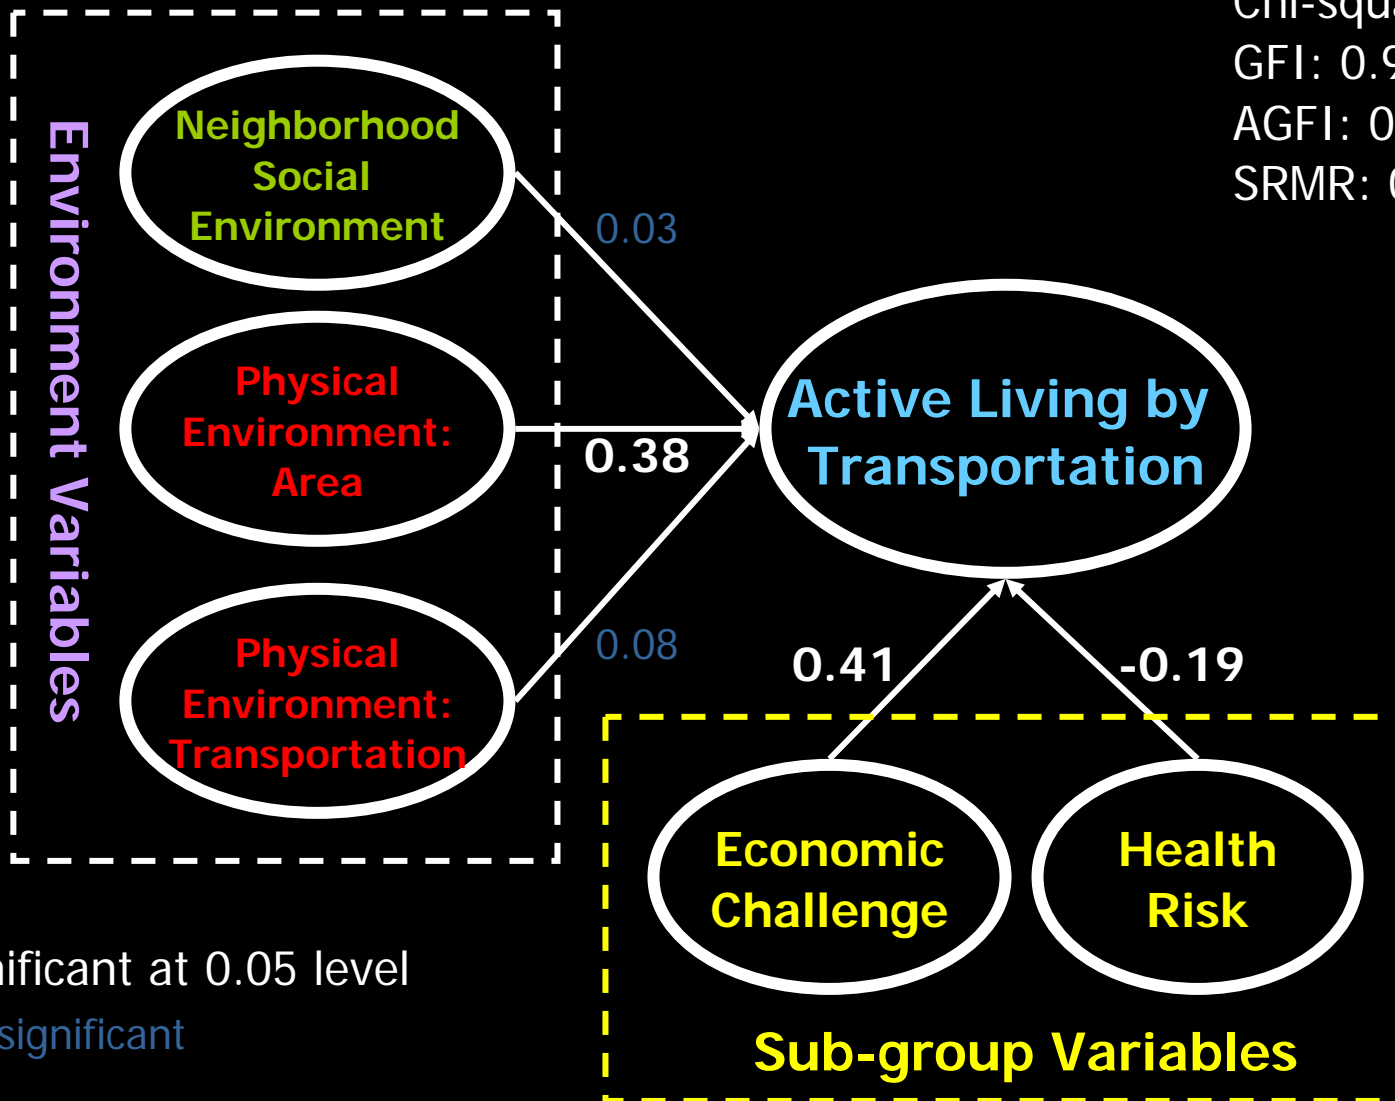

Structural Equation Model

Chi-square: 373.49

GFI: 0.93

AGFI: 0.90

SRMR: 0.059

Significant at 0.05 level

Not significant

Findings:

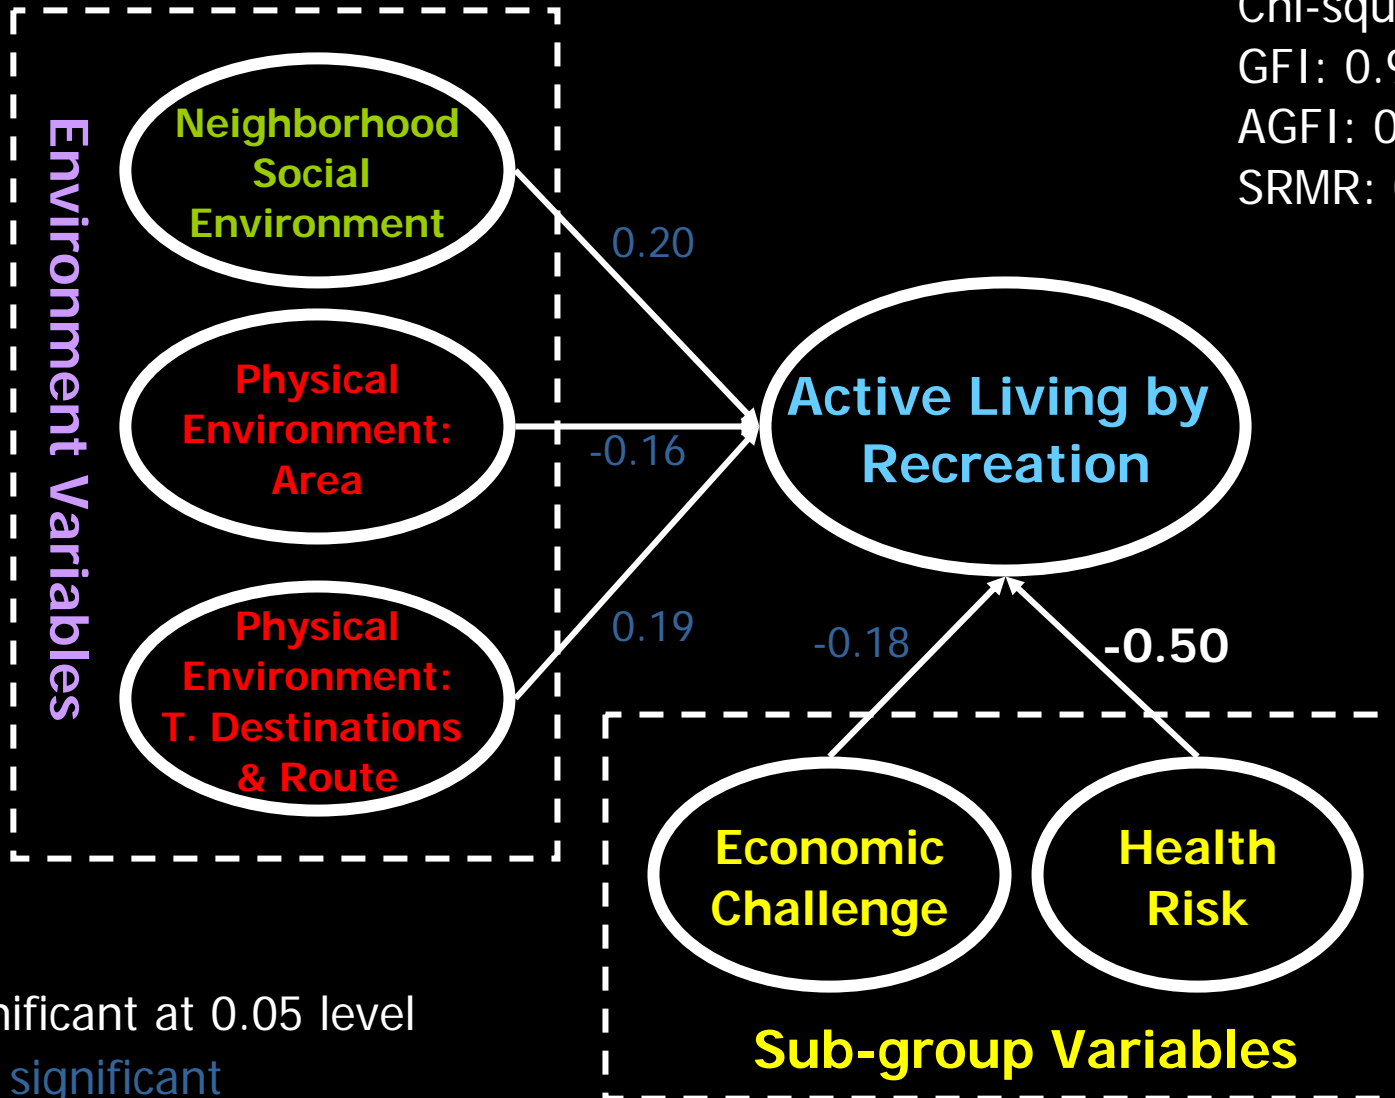

Structural Equation Model

Chi-square: 330.41

GFI: 0.94

AGFI: 0.91

SRMR: 0.051

Significant at 0.05 level

Not significant

Summary: Bivariate and SEM

		Hypo.	Found
High Health Risk (Low Health Status)	Neighborhood Social Environment	-	-
	PE: Area	-	ns
	PE: Transportation	-	ns
	PE: Recreational	-	ns
	Active Living by Transportation	-	-
	Active Living by Recreation	-	-
High Econ. Challenge (Low Econ. Status)	Neighborhood Social Environment	-	ns
	PE: Area	+	+
	PE: Transportation	+	+
	PE: Recreational	-	ns
	Active Living by Transportation	+	+
	Active Living by Recreation	-	ns

Limitation

- Cross-sectional
- Self-reported data on physical activity
- Urban setting
- Other variables
- Many more...

Conclusions/Lessons

- Different Physical Activity Levels among Different Sub-Populations
- Different Levels of Environmental Supports for Active Living for Different Sub-Populations
- Different Environmental Correlates of Physical Activity by Different Purposes
- Overall Support for the Two Conceptual Models to Guide Future Research
