University of Houston

# Background

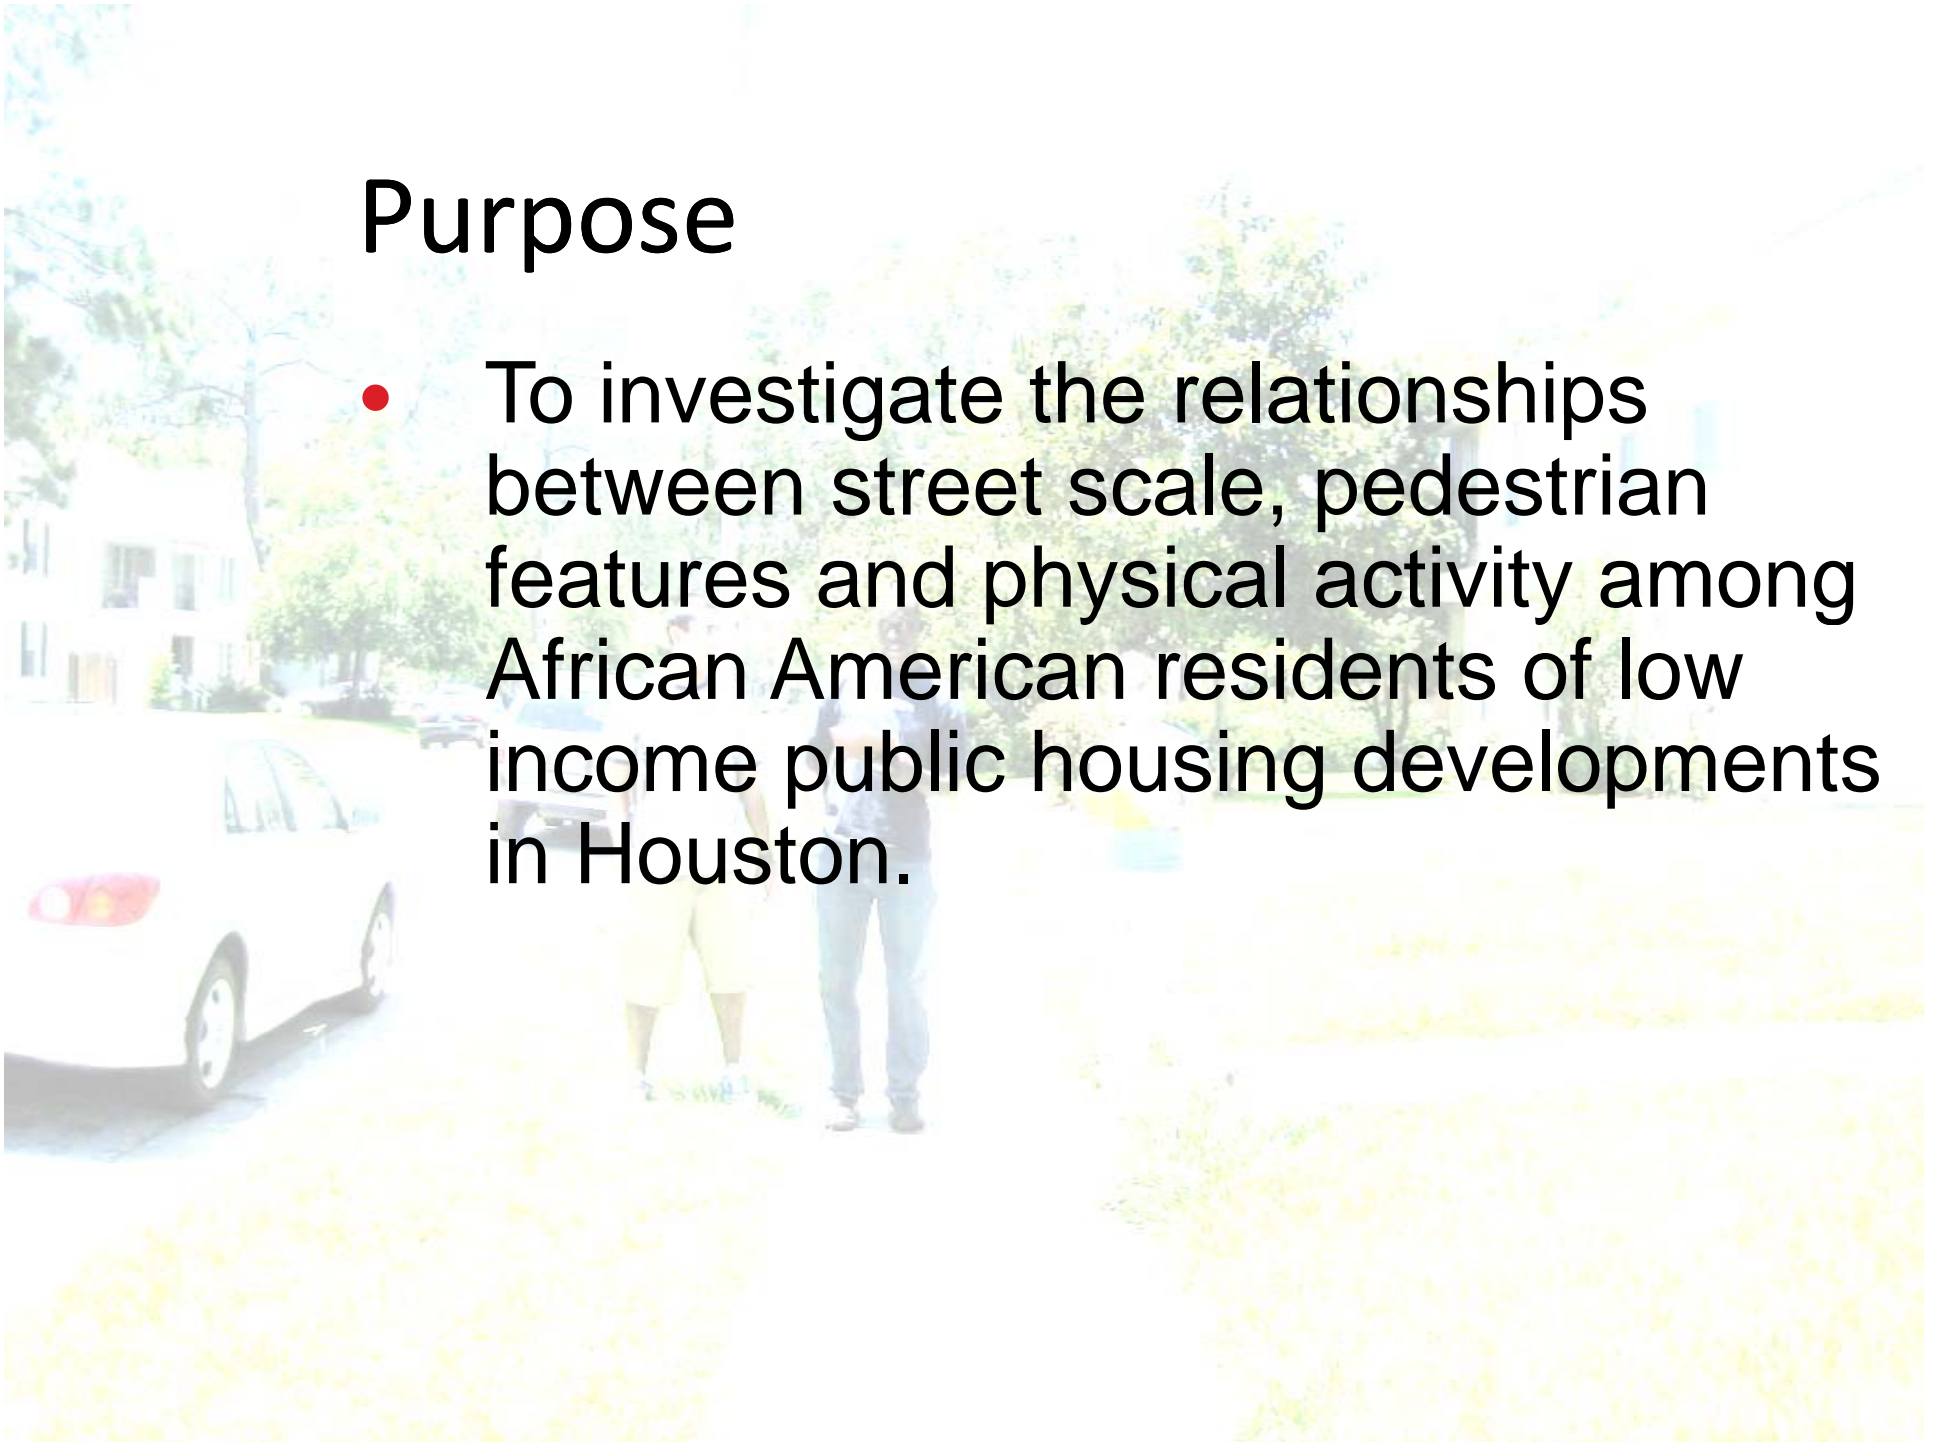

- Physical activity often done on neighborhood streets
- Lower SES neighborhoods may have poorer quality street level conditions
- Little is known about the relationship between street scale elements and physical activity, particularly in under represented populations

# Purpose

- To investigate the relationships between street scale, pedestrian features and physical activity among African American residents of low income public housing developments in Houston.

# Physical activity opportunities in low socioeconomic status neighbourhoods

Increased availability of neighbourhood physical activity resources can help to promote physical activity among residents, even in very low socioeconomic status neighbourhoods.<sup>1</sup> Residents of low-income, government subsidised, public housing have extremely low rates of physical activity and high rates of obesity, in part driven by lack of neighbourhood physical activity resources.<sup>2-4</sup> Federal and State Policies governing features and amenities in public housing developments themselves can help to ameliorate this situation.<sup>5</sup> Contrasted here are one public housing development in a lower income neighbourhood (top; median household income = \$9766) with frequently used physical activity resources located on the housing development property and one public housing development in a higher income neighbourhood (bottom; median household income = \$70 833) with no physical activity resources on the property. Despite location in a much lower socioeconomic status neighbourhood, physical activity resources and opportunities for residents are significantly better compared to those in the higher socioeconomic status neighbourhood.

# Neighborhood Assessments

- Every street segment ( $N=2,093$ ) was assessed using the Pedestrian Environment Data Scan (PEDS; Clifton et al).

Assessor Name: _____	Date: _____	Time: _____	
Participant ID: _____	Street segment ID: _____	Weather: _____	

<b>0. Segment type</b>		<i>If no sidewalk skip now to section C.</i>	
Low volume road	<input type="checkbox"/> 1	<b>11. Curb cuts</b>	None <input type="checkbox"/> 1
High volume road	<input type="checkbox"/> 2		1 to 4 <input type="checkbox"/> 2
Bike or Ped path - skip section C	<input type="checkbox"/> 3		> 4 <input type="checkbox"/> 3
<b>A. Environment</b>		<b>12. Path completeness/continuity</b>	
<b>1. Uses in Segment (all that apply)</b>		Path is complete <input type="checkbox"/> 1	
Housing - Single Family Detached	<input type="checkbox"/> 1	Path is incomplete <input type="checkbox"/> 2	
Housing - Multi-Family	<input type="checkbox"/> 2	<b>13. Path connectivity to other paths</b>	
Housing - Mobile Homes	<input type="checkbox"/> 3	number of connections _____ 1	
Office/Institutional	<input type="checkbox"/> 4	<b>C. Road Attributes (skip if no road is present/path only)</b>	
Restaurant/Cafe/Commercial	<input type="checkbox"/> 5	<b>14. Condition of road</b>	
Industrial	<input type="checkbox"/> 6	Poor (many bumps/cracks/holes) <input type="checkbox"/> 1	
Vacant/Undeveloped	<input type="checkbox"/> 7	Fair (some bumps/cracks/holes) <input type="checkbox"/> 2	
Recreation	<input type="checkbox"/> 8	Good (very few bumps/cracks/holes) <input type="checkbox"/> 3

# Individual Assessments

- Interviewer administered questionnaire
- International Physical Activity Questionnaire (short form)
- One week pedometer protocol

# Flow of Individual Assessments

# Analyses

- Descriptive Statistics
- Extensive Bivariable Associations
  - PEDS variables interrelationships
  - PEDS, co-variates and outcomes
- Regression Models
  - Ecologic aggregate analyses
  - Separate by gender
  - Adjusted for age and neighborhood density
  - Bivariable analyses informed models

# Participant Characteristics

---

	Women ( <i>N</i> =139)	Men ( <i>N</i> =77)
Age	43.29	43.79
BMI (kg/m <sup>2</sup> )*	33.0	28.3
Systolic BP	120 mmHg	123 mmHg
Diastolic BP	74 mmHg	74 mmHg
Heart Rate (bts/min)	76.1	73.5

---

## Physical Activity Outcomes (by gender)

	Women	Men
Vigorous Intensity*	1,955	2,896
Moderate Intensity*	733	1,309
Walking*	1,080	1,376
Total Physical Activity*	3,768	5,581
Pedometer Steps	29,792	33,786
Pedometer Calories	1,209	1,463

\*Women demonstrated higher measured BMI and reported significantly less vigorous, moderate, walking and total PA on the IPAQ compared to men ( $p < .01$ ). IPAQ outcomes presented in MET—minutes.

# PEDS Short List

- Pedestrian buffers
- Sidewalk connections
- Automobile travel lanes
- Crossing aids
- Traffic control devices
- Amenities
- Bicycle facilities
- Speed limit

# Conclusions

- Neighborhood street scale elements influence resident physical activity
- Lower speed limits are most closely linked with physical activity
- Some evidence for gender specific sensitivity to street scale elements
- Future research
  - Replicate these findings
  - Understand how to strike a balance in promoting physical activity in both women and men
