

Data processing & cleaning

- Cleaning in physical activity studies
 - Often limited wear time so not needed
 - Not well reported
- Processing in Transportation studies
 - More sophisticated
 - Use GIS data
 - Mostly car based

PALMS

- Physical Activity Location Measurement System
- Data processing is key (& expensive)
 - Want to avoid reinventing wheel
- Need a system that is flexible & user friendly
- Support a community of users & developers
- **<http://ucsd-palms-project.wikispaces.com>**

GPS Data Processing

Before – Multi-story buildings generate noise

After – Noise removed
Yellow = walking Orange = paused
Gray circles = relative time at location

GPS Variables

Inputs	Outputs
Date / Time	Date / Time, Duration
Latitude / Longitude	Latitude / Longitude Distance traveled, Direction (bearing)
Elevation	Elevation, Elevation delta, Grade
Satellite info (optional)	Indoors or outdoors / Fix type
Derived by algorithms	Trips: Start, end, pauses Duration, Length, Speed (Avg, Max) Estimated mode of transportation
	Locations: Time spent at location, Time away from location, Trips to/from location Number of visits to location, frequency

PALMS' Multi-step Approach to Processing

- 1) Pre-process trackpoints
- 2) Detect and mark as indoor or outdoor
- 3) Filter invalid and duplicate trackpoints
- 4) Detect trips
- 5) Find location clusters & mark locations
- 6) Reconsider trips
- 7) Classify and number trips
- 8) Capture trackpoints at locations (if desired)
- 9) Average speed and elevation (if desired)
- 10) Align to desired interval

GPS Processing: Parameters, Cutoffs & Options

- All processing steps have parameters.
- In PALMS, all default parameters are visible and adjustable.
- Because of the multiple steps, parameter values of the earlier steps impact the results of downstream processing.

The screenshot displays a software interface for GPS processing, organized into three main sections:

- Invalid values filter:** This section contains several input fields for filtering data: "Filter invalid fixes" (0), "Max speed (KM/hour)" (130), "Max change in elevation (meters)" (5000), "Max change in distance (meters)" (30), "Min change in distance (meters)" (10), and "Max loss of signal" (3600). A checkbox for "Lone fixes" is checked.
- Location detection:** This section includes three checkboxes: "Detect locations before trips" (unchecked), "Include trip pause locations" (checked), and "Trap points within location" (unchecked). Below these are input fields for "Cluster radius (meters)" (100), "Min time at location" (180), "Number of cluster iterations" (1000), and "Max number of clusters" (100).
- Trip detection:** This section starts with a checked checkbox for "Detect trips". It includes input fields for "Min distance traveled over 1 minute (meters)" (30), "Min trip length (seconds)" (100), "Min trip duration (seconds)" (180), "Min pause time (seconds)" (180), and "Max pause time (seconds)" (300). A checked checkbox at the bottom reads "Allow trips within a single location".

Any questions, all questions are good!

Savage Chickens

by Doug Savage

www.savagechickens.com

GPS Filtering (optional)

- Refine grossly invalid trackpoints (bad fixes)
- Refine redundant trackpoints (non-movement)
- Refine extraneous data points (jitter)

Before

After

Color coded by speed

GPS Filtering Algorithms

- Filter lone-fixes – do not filter first and last fixes
- Determine if trackpoint is valid
 - Check for excessive speed ($> X$)
 - Check for excessive change in elevation
 - Check for excessive distance traveled between trackpoints
- Determine if trackpoint is redundant
 - Check for minimum change in distance between trackpoints (redundant)
 - Check for forward / backwards movement (jitter)
- If invalid or redundant, delete trackpoint from vector and update derived values in adjacent trackpoint

Active Living Research

Building the Evidence to Prevent Childhood Obesity and Support Active Communities

GPS Indoor/Outdoor Detection

GPS Indoor/Outdoor Detection

- Qstarz GPS provides
 - Number of satellites in view
 - Number of satellites used to compute location
 - “Signal strength” of each satellite
- Outdoors = stronger signals and more satellites
 - Mark outdoors if total signal strength > threshold
 - Mark outdoors if ratio of SatUsed to SatView > threshold
- Problems to be addressed:
 - Outdoor points can be marked as indoors when traveling through area of poor coverage
 - Indoor points can be marked as outdoors if threshold values are not set correctly (typically occurs under wooden roofs)
 - In-vehicle points typically marked as indoors

GPS Trip Detection

- Detects starting and stopping locations of trips
- Detects short pauses during trips
- Note: start point variations due to time to acquire first fix.

Starting point

Ending point

In motion

Paused

GPS Trip Detection

- Marks Trackpoints as either:

Stationary

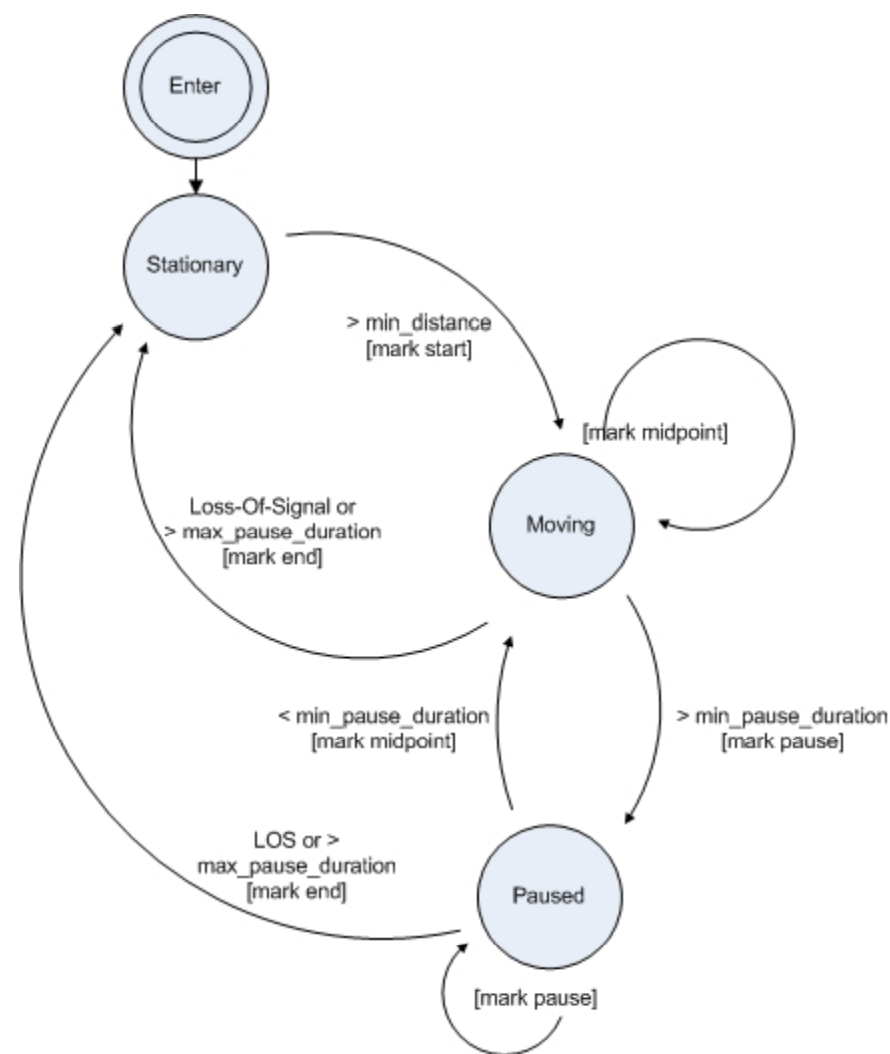

Start points

Mid points

Pause points

End points

- Start point marked when distance traveled $>$ threshold
- End points marked on loss of signal or when duration at point exceeds a time threshold
- Pause points when distance travel $<$ threshold & duration at point within a time threshold

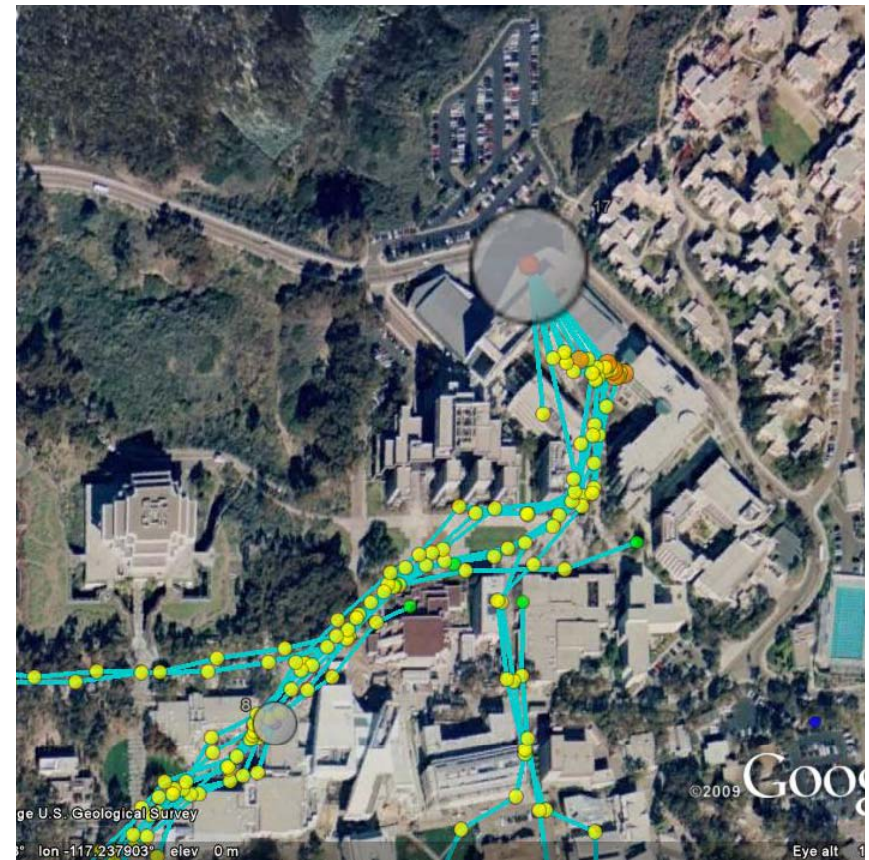

GPS Location Detection

- Detect clusters of activity, time spent, most visited, etc.

Location Capture (optional)

- Map all points (not part of a trip) within a radius to the location center.
- Map indoor points to the location center.

GPS Trip Post Processing

- Reconsider trips
 - Remove trips where total distance < threshold
 - Remove trips where total duration < threshold
 - Remove trips contained within one location
 - Remove trips totally indoors
- Number trips
- Classify mode-of-transportation based on average speed cutoffs

Mode of Transportation

- Classify trips as walking, running, bicycle, vehicle
- Average trip speed used as initial classifier
- Current implementation needs a pause point to detect mode changes within a trip (walk – car – walk)
- Assisted by use of accelerometer and/or heart rate data (if available)

Validation study

- To test the sensitivity & specificity of PALMS algorithms
- Data set that can be used to test improvements in calculations
- Data set that can be used as a demonstration set
- Protocols that can be used by other researchers

Aggregating data

- Creating meaningful variables from millions of data points
- # trips, distance travelled
- Time spent in locations & modes
- Daily & event based summaries

Integration with GIS (Geographic Information System)

- Aggregating GPS data
 - Select in time and space
- Include environmental characteristics
 - Green space, sport facilities, cycle routes, land use mix, intersection density, etc.
- Animate activity and movement

Enable time field - new in ArcGIS 10

Active Living Research

Building the Evidence to Prevent Childhood Obesity and Support Active Communities

1 school recess, four 5th grade students

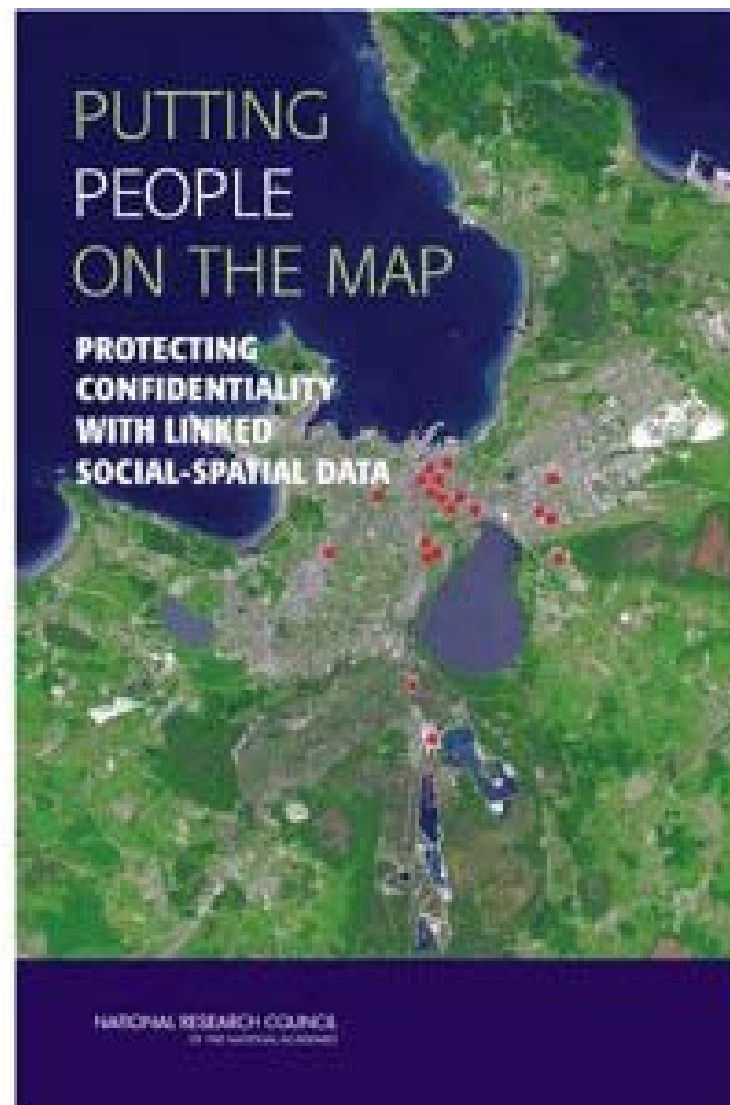

How to do all this in GIS?

- Helps to have GIS expert on team
- Developing step by step guide
- Developing a PALMS ArcGIS toolbar

Limitations/caution

- Privacy issues
- Staff time/cost
- Data size & quality
- Sample sizes
- New analytical techniques

Summarize

- Why it is challenging
- Why it is worth it
- What you need to do to get good data
- What you need to do to make sense of it all
- What next?

WELCOME to the GPS-HRN

The Global Positioning Systems in Health Research Network is an international collaboration of academics and health professionals interested in GPS technology. This website is an online meeting place for members to share ideas and experiences relating to their work with GPS. GPS-HRN membership is by application only. To apply, please follow the link at the top right of this page.

Background to the GPS-HRN

Who are we?

The Global Positioning Systems in Health Research Network was launched at the 2009 International Society for Behavioural Nutrition and Physical Activity Conference in Cascais.

The aim of the GPS-HRN is to establish a communication forum that will allow GPS researchers to share ideas and experience.

The GPS-HRN administration team is based out of AUT University in New Zealand, UCL in the UK, and the University of Lausanne in Switzerland.

Lead Coordinator: Dr Scott Duncan (AUT University)
Asst Coordinator: Dr Hannah Badland (University College London)
Asst Coordinator: Dr Melody Oliver (AUT University)
Chair: Prof Yves Shutz (University of Lausanne)

The GPS-HRN is currently sponsored by AUT University; however, we will be pursuing further funding for the ongoing maintenance of the network.

Active Living Research

Building the Evidence to Prevent Childhood Obesity and Support Active Communities

- EXTRAS if needed

- Test accuracy of algorithm to detect
 - Trips, Modes, Locations, Indoor/Outdoor
- Test Conditions
 - Cold/warm start
 - Urban canyon vs open space
 - 4 different modes of transportation
 - walking, cycling, bus riding, driving
 - Effects of pauses
 - transition modes and pauses within some tours
 - Data collected at 5, 15, and 30 second epochs
 - Device comparison
 - GPS: DG-100 and Qstarz BT1000XT

Methods

- Trained raters wear
 - Activity meters: GT3X, ActiTrainer, GT3X+
- Carry 2 boards each with 6 devices in backpack
 - Cold start/warm start
 - 2 device models
 - 3 epochs
- Follow a set protocol of trips & pauses
- 4 trip examples per condition, 500+ trips
- Note start time for each movement change

Analyses

- **Validation Questions**
 - E.g. How ‘good’ is PALMS at detecting walking trips?
- **Challenges**
 - Not independent observations – nested data
 - Determining unit of analysis
 - Not naturalistic sampling of trips
- **Determine the referent – define a ‘hit’ or ‘miss’**
 - Percentage of rows with correctly identified modes of transportation in a day
 - Number of trips correctly identified in a day
- **Summary measures of agreement**
 - Sensitivity, specificity, Kappa – assumes independent observations
- **Predictors of agreement – multi-level models (e.g. GLM)**
 - IVs – Trip type, position in tour, trip number of the day, urban/open, etc.

GPS Filtering: Illustration

If $D(n,n+1) < \text{minimum_distance}$, then remove $n+1$

If $D(n,n+2) < \text{minimum_distance}$, then remove $n+1$

Point 1 - kept (first fix)

Point 2 - delete ($< \text{min}$)

Point 3 - delete (forward and backwards 1-3-4)

Point 4 - delete ($< \text{min}$)

Point 5 - delete ($< \text{min}$)

Points 6, 8, 10 - kept as valid

Points 7, 9 - delete ($< \text{min}$)

GPS Trip Detection

- Points 1-5 previously filtered to one stationary point (point 1)
- Point 6 detected as start of trip based on distance traveled
 - mark point 1 as start of trip, mark point 6 as midpoint
- Points 7,9 previously filtered as redundant
- Points 8,10,11,12 identified as midpoints on the trip based on distance traveled
- Point 13-16 previously filtered to one stationary point (point 13)
- Point 13 detected as end point (time at point exceeded)

GPS Location Detection: PALMS implementation

- If trackpoint = First fix or Last fix or Start point or End point or Pause point, then add to location list
- If time at a trackpoint $>$ threshold, then add to location list
- Once all trackpoints have been processed, find adjacent locations (distance between locations $<$ threshold)
- For those adjacent locations, determine which location has the greatest amount of time spend at that location
- Collapse nearby locations to that location
- Number locations
- For each trackpoint, determine if it is within the location and if so, assign the location number to the trackpoint.

GPS Pre-processing: Derived Values

Given two fixes F1, F2 with time, lat, lon, ele

Distance = `great_circle(F1,F2)`

Duration = `F2.time - F1.time`

Elevation Delta = `F2.ele - F1.ele`

Speed = `Distance / Duration`

Grade = `Elevation Delta / Distance`

(change of 6m over 100m = 6% grade)

GPS Pre-processing

- Calculates distance, duration, speed, elevation-delta, grade and bearing between adjacent trackpoints

- Detects loss-of-signal
 - Defined as the duration between trackpoints exceeding X minutes (gaps in time)
 - Marks first, last and lone fixes

- Calculates SNR (signal to noise ratio) of satellites in view and satellites used to obtain fix (for Qstarz GPS)
