Bike Sharing

“individuals use bicycles on an as-needed basis without the costs and responsibilities of bike ownership...”

Four Generations

What is it? | Ridership Forecasting | Applications

User Experience

- 3-speed
- Quick-adjust
- Heavy (durable)

Where is Bike Sharing?

Denver B-cycle – Denver, CO

Nice Ride – Minneapolis / St. Paul, MN

Capital Bikeshare – Washington D.C.

BIXI – Montreal, Quebec

- Boston
- Boulder
- Madison
- Miami
- Spartanburg, SC

- New York
- Chicago
- Los Angeles

- Monterey?
- Santa Monica?
- San Diego?

Bike Sharing Benefits

- Increased mobility
- Cost savings
- Lower implementation costs
- Reduced traffic congestion
- Reduced fuel use
- Increased use of transit
- Greater environmental awareness
- Increased physical activity and health benefits

Bike Sharing Benefits

- Increased mobility
- Cost savings
- Lower implementation costs
- Reduced traffic congestion
- Reduced fuel use
- Increased use of transit
- Greater environmental awareness
- **Increased physical activity and health benefits**

Ridership Forecasting

- Feasibility or Implementation Study
 - Station size/location and system scope
 - Supports financial analysis
- System Expansion
 - Locate stations to serve most riders

Three U.S. Systems

Denver B-cycle – Denver, CO

Nice Ride – Minneapolis / St. Paul, MN

Capital Bikeshare – Washington D.C.

Ridership Forecasting Model

capital bikeshare™

DENVER B cycle™

NICE RIDE

Regression Model
Density
+ Demographics
+ Network Effects
→ Ridership

Demographic Variables

- Significant relationships:
 - Population
 - Retail Jobs
 - Alternative Commuters
 - Graduate Degree
 - Median Income
 - Non-White Population (negative)

A Caveat on Income and Race

- Income and Race variables included to explore empirical relationship with ridership
- Low-income or majority non-white areas should not be excluded
- May require additional outreach or programs targeted to specific needs

Bikesharing and Network Effects

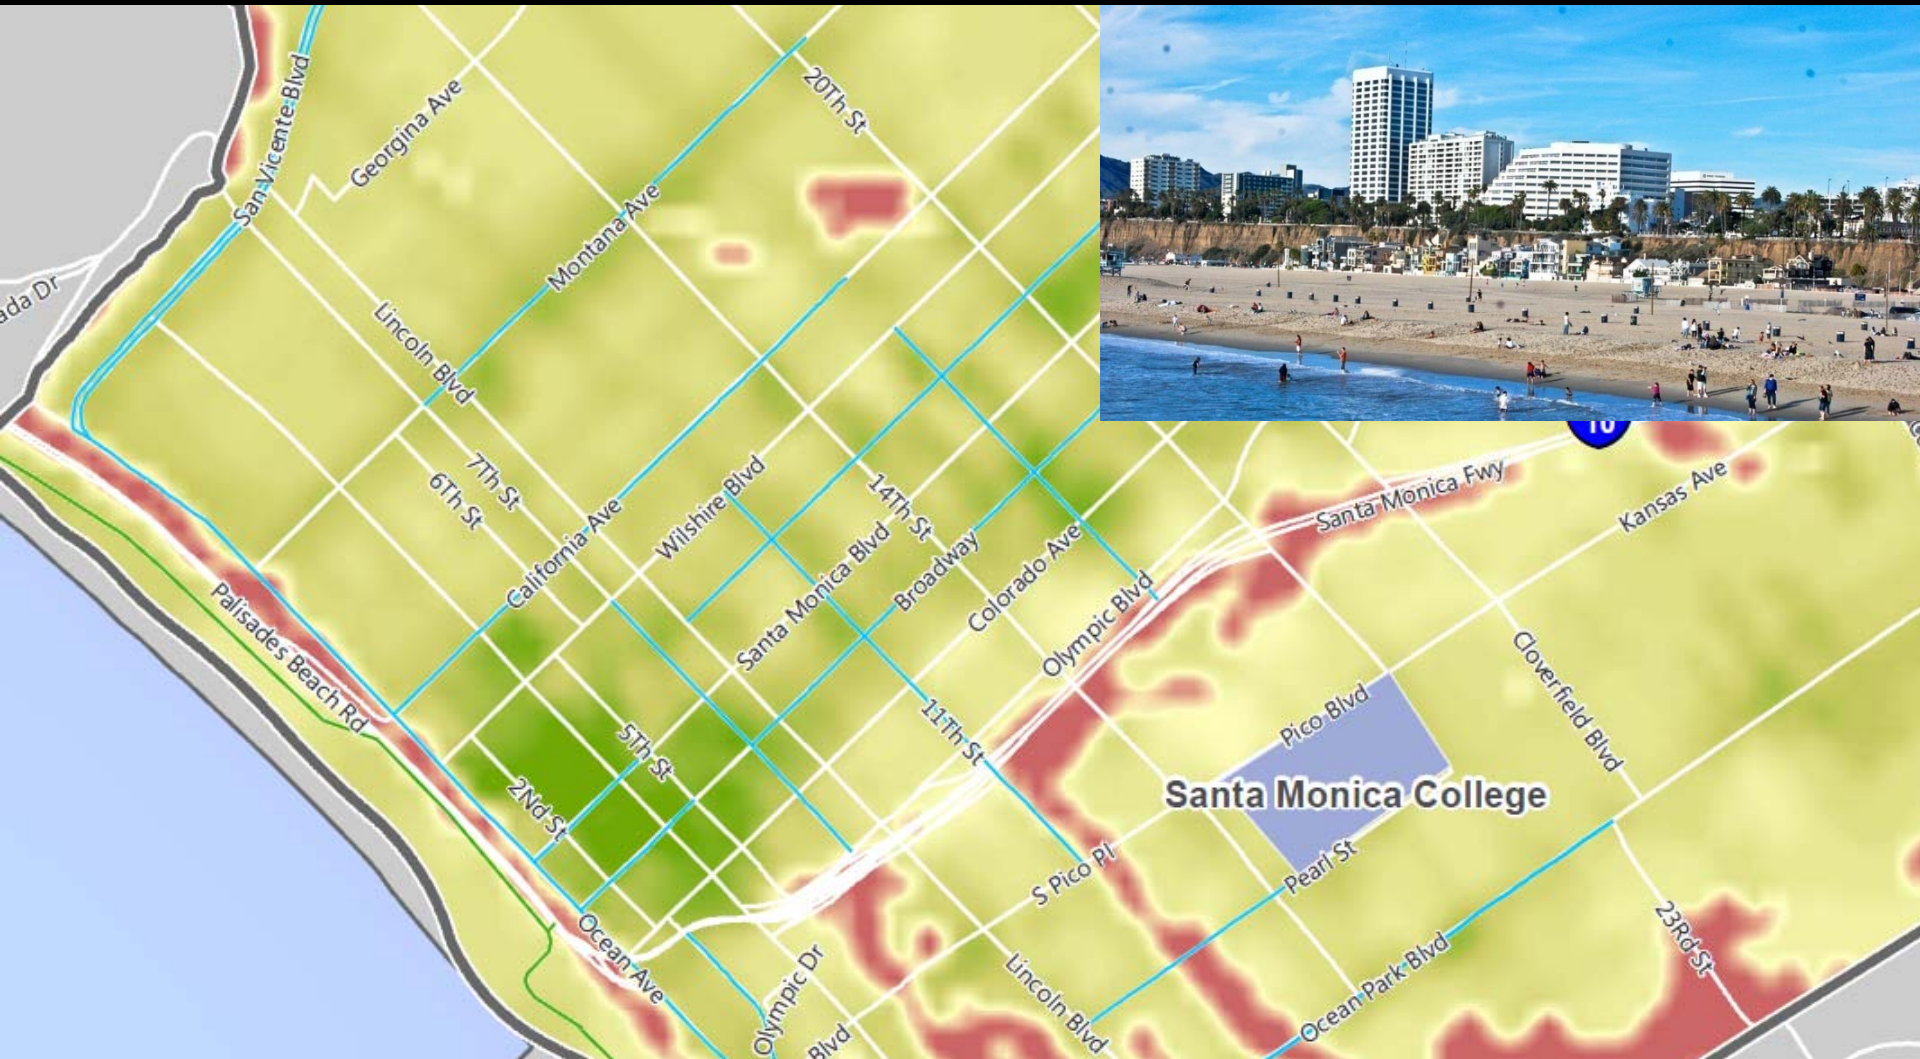

- Pick up and drop off at any station
- Approaching point-to-point travel
- System becomes more useful as more stations are added

Ridership Forecasting Model

- Highest ridership in areas with high
 - Connectivity to other bikesharing stations*
 - Population and retail job density
 - Median income levels
 - Share of alternative commuters
- Race and income results should be interpreted with care
- Bike infrastructure warrants further research
- Caveat: results based on early-adopting users

Applications: Santa Monica

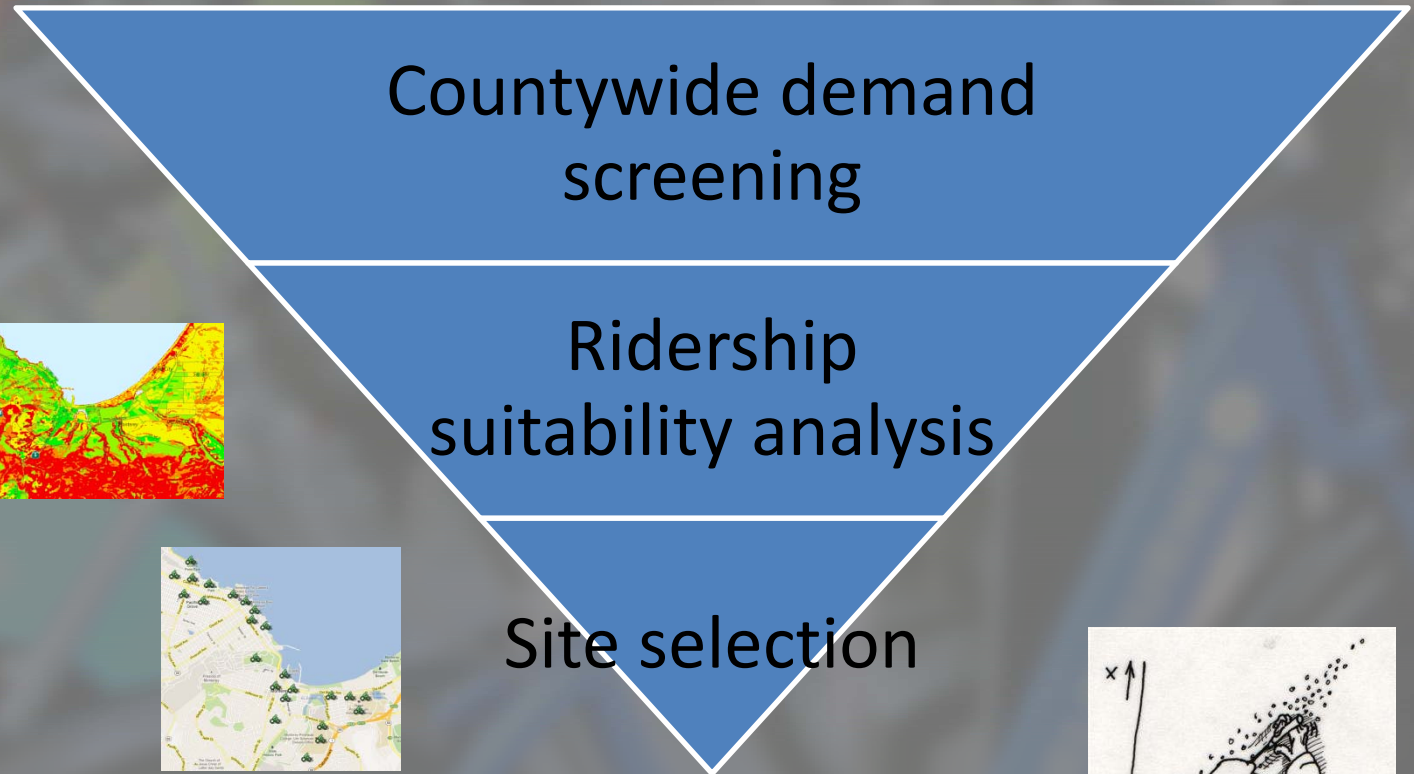

Applications: Monterey

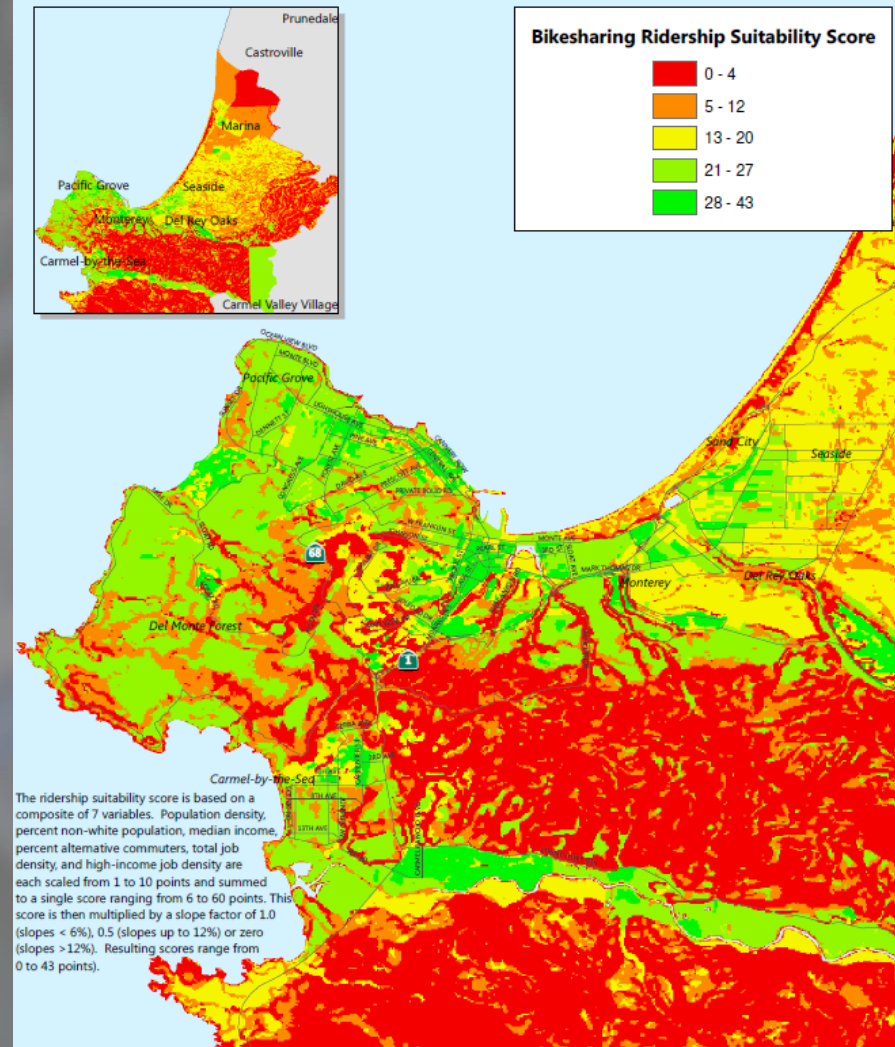

What is it? | Ridership Forecasting | **Applications**

Demand Estimation

Ridership Suitability Analysis

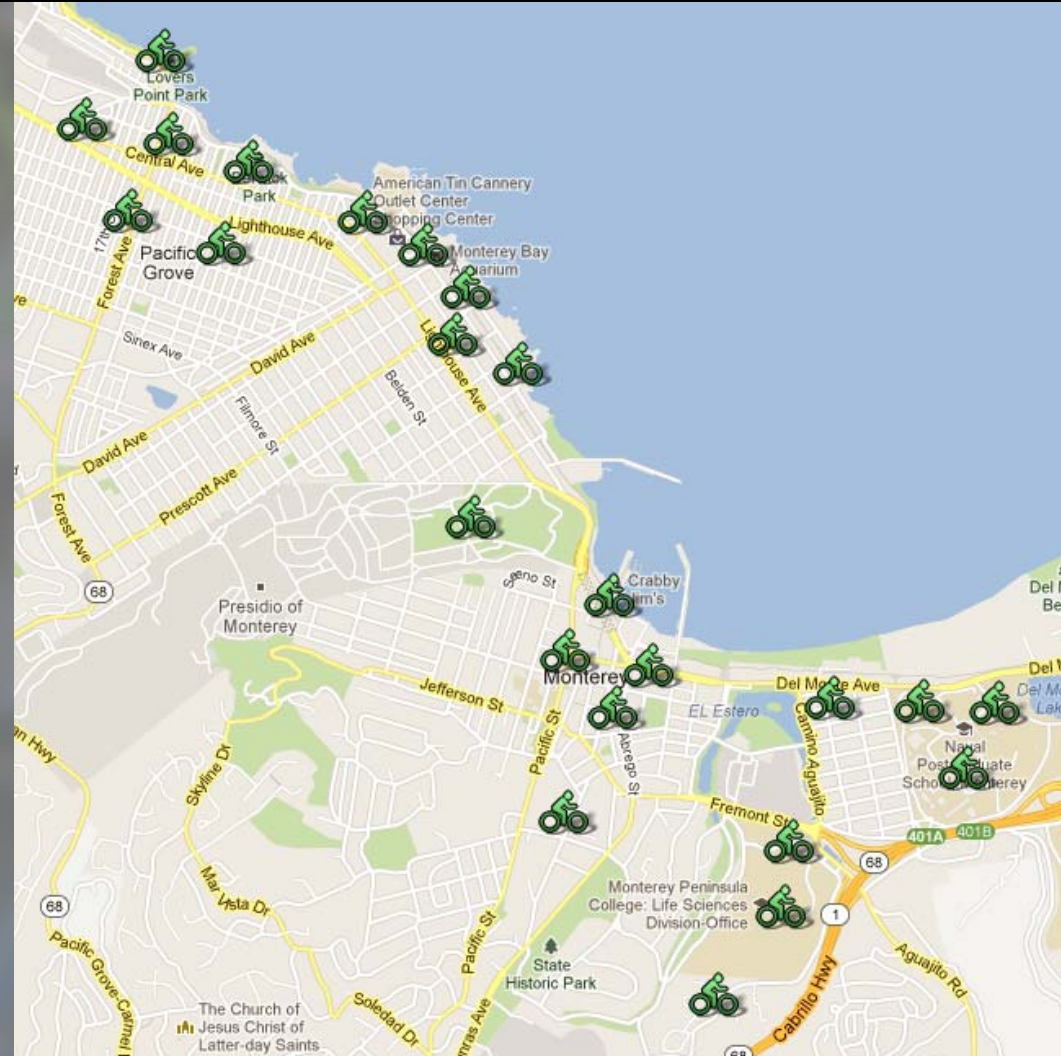

- Goal: maximize ridership
 - Demographic factors
 - Job and population densities
 - Slope

Site Selection

Locate stations:

- In a contiguous **network**
- Near **bike facilities**
- Along flat or gently rolling **terrain**
- Near **institutions**
- Near **dense** commercial and residential areas
- Near **attractions**
- To connect with **transit**

Monthly Ridership Scenarios

	Base Scenario	Low Scenario	High Scenario
Total	3,027	1,568	5,842
Station Average	126	65	243
Station Minimum	96	50	185
Station Maximum	280	185	540
