Project Aims

- Develop, field test, and refine an automated monitoring system based on a complementary metal oxide semiconductor (CMOS) image acquisition sensor that addresses the weaknesses of existing systems
 - Assess reliability and validity of the sensor
 - Provide documentation of hardware and software, to be placed in the public domain
-

Reliability and Validity

Concurrent validity:

Association between automated system counts and observer counts from concurrent videotapes

Reliability:

- a) Inter-observer and intra-observer reliability
 - b) Inter-instrument reliability
-

Data Collection Plan

- Varying conditions
 - Time of day
 - Season
 - Weather
 - Varying locations
 - Indoor stairwell
 - Paved track
 - Natural surface trail
-

Major Variables

- User – a subject for whom at least one passage past the monitored space is recorded during a given measurement period
- User count
- User passage count (per user count)
- User passage volume

Progress to Date

- Human subjects approval obtained
- Electronic components acquired
- Counters constructed
- Mounting hardware installed at trails
- Software written

Progress to Date

- ❑ Counter pre-tested in the field
- ❑ Troubleshooting hardware
- ❑ Software revisions -- ongoing
- ❑ Data collection to begin
 - expected February 2004
